Provision for the future is made by the assumption of high moving loads for both the upper and lower decks. The total moving load the arch is computed for is 15,000 lb. per linear foot of bridge. Compared with the moving load assumed for the Manhattan or Blackwell's Island Bridges, which are designed for the heavist loads as yet provided in long-span bridges, the equivalent moving load for the Henry Hudson Memorial Bridge would be 14,000 lb. per linear foot for congested load and 7,000 lb. for working load.

Thus, it may be stated, all possible effects on the arch are considered and will be provided for as far as the state of engineering science and the physical character of the material used will permit.

Material Used and Stresses Allowed for It.—As stated above, the materials of the main arch are to be concrete and steel. The arch is to be formed of a solid rib of concrete 70 ft. wide, 15 ft. thick at the crown and gradually increasing to a thickness of 28 ft. at the skewbacks. Embedded in the concrete are 48 rectangular units of four 8x8-in. angles, each laced on all sides. They are arranged in twelve vertical rows or frames which are thoroughly connected, both vertically and horizontally, to each other by bracing, forming a hugh steel cage of great rigidity. The steel members of the vertical piers are riveted to the steel frames, securing positive connection for the part of the structure above the rib. The steel units bear with suitable footings

directly on the rock and are anchored to it. The distribution of the steel in the concrete is uniform throughout its mass, completely supporting all its parts.

The embedded steel performs two functions: it first carries a certain portion of the load determined by the relative elasticity of the concrete and the steel, and secondly, it enables the concrete to act as a hemogeneous mass. The method of reinforcing by box-like units also bands the concrete, furnishing to it a lateral restraint, the great value of which in resisting compressive strains has come to be universally appreciated in recent years. It may well be stated here that the material of the rib will be called on to resist compressive stresses only and that under no conditions can any tensile stresses be induced.

Little need be said as to the quality of the steel required. A good structural steel satisfying the standard specifications of the Department of Bridges will be all that is required.

The concrete, on the contrary, deserves special consideration. The strength of concrete varies with the proportions and qualities of the constituent materials. It is intended to specify for the main structure a concrete at least as rich as one part of Portland cement to six of sand and broken stone properly balanced, which should develop an average compessive resistance of 3,000 lb. per square inch on a 12-in. cube 30 days old with a least resistance of 2,700 lb. per square inch. Since a least increase in strength of 10 per cent. can be counted on in two months, this would insure an average compressive resistance of 3,300 lb. per square inch with a mininum of 3,000 lb. at the end of three months. The method of specifying a concrete of a certain compressive resistance in addition to the usual specifications for the cement, sand and stone, has been approved and recommended by several foreign engineering societies and committees, and is in use in the best European and American practice. It should be applied in the case of the Henry Hudson Memorial Bridge.

The increase in strength with age of mortar and concrete is a well known fact. It may be illustrated here by a few records.

Experiments conducted on the effect of age upon the increase in tensile strength of mortar, by Dyckerhoff, for the German Association of Portland Cement Manufacturers, gave the results in the accompanying table.

INCREASE IN PERCENTAGES OF INITIAL TENSILE RESISTANCES.

Time	1:1 Mortar	1:2 Mortar	1:3 Mortar
4 weeks	Initial	Initial	Initial
13 weeks	51	44	48
26 weeks	53	47	51
1 year	66	60	56
2 years	131	108	118
3 years	125	119	98
4 years	131	124	141
5 years	152	142	148

The increase in the strength of concrete with age is not as rapid in the early months as it is in mortar, but is more gradually distributed through the first year.

Numerous tests on 12-in. concrete cubes were made at the United States Arsenal at Watertown, Mass., with cements of the better brands, in the proportions of one part of cement to two parts of sand and four parts of broken stone, developed a compressive resistance of 3,000 to 3,600 lb. per square inch at the age of three months.

An experimental arch was built in 1896 at Stuttgart, Germany, of a span of 65.6 ft. and observed under various loads and temperatures during five years. It was made of a concrete of one part of Portland cement and 7½ parts of broken limestone, using the product of the crusher to take the place of the sand. Test specimens of this concrete two years old developed a compressive resistance of 7,260 lb. per square inch. Blocks cut out of the arch after failure and probably somewhat impaired in strength by the shock of the collapse developed at the age of five years 6,615 lb. per square inch or 10 per cent. less than the test specimens.

The concrete of the Munderking arch was of the proportions of one part of cement to 2½ parts of sand and five of broken stone. At the age of 28 days it developed a compressive resistance of 3,615 lb. per square inch which at the age of 152 days increased to 4,720 lb. At the age of two years and eight months it had attained a resistance of 7,130 lb. per square inch on the specimen and 10 per cent. less on the concrete in the structure. The concrete of the viaduct over the Chemnitz Valley was of the proportions of 1:4:4-½. It developed at the age of 28 days a compressive resistance of 3,070 lb., and at the age of 90 days of 3,770 lb. per square inch. The concrete of the Exhibition Bridge at Duesseldorf was of the proportions of 1:4:4. It developed at the age of 28 days a compressive resistance of 3,610 lb. and at the age of 90 days of 3,940 lb. per square inch.

All of the above data are for concrete not reinforced by steel. The additional assistance furnished by the embedded steel in enhancing the homogeneity and creating a lateral restraint will be so much additional margin of strength. To determine the relative increase in strength due to the latter and also to demonstrate the degree of the co-operation of the two materials a short series of tests is about to be made by the Department.

Unit Stresses in Arch-Rib.—The compressive stress on the steel embedded in the concrete will not be allowed to exceed 20,000 lb. per square inch, allowing for all possible causes of stress. This is perfectly safe for a material of an elastic limit of 30,000 lb. per square inch, thoroughly braced and fully embedded.

The greatest stress to be allowed on the concrete in compression due to a combination of all of the causes enumerated in the above discussion on methods of computation has been fixed at 750 lb. per square inch. This is one-fourth of the least strength of the concrete at the age of three months. Compared to the common methods of computation the equivalent stress would be not more than 600 lb.

The French Government Commission on Reinforced Concrete, which completed its labors about a year ago, has recommended that "the limit of compressive stress for reinforced concrete to be allowed in computation shall not exceed two-sevenths of the crushing strength of plain concrete of the same proportions and at the age of 90 days." This would allow for a concrete of 3,000 lb. compressive resistance a stress of 860 lb. per square inch.

A noted German engineer, Mr. Leibbrand, who has built many concrete bridges, says: "The more reliable determination of stresses properly allows the use of higher working stresses. For the very best concrete up to 1,030 lb. per square inch in compression may be allowed."

The rib will be erected on falsework and the centers will not be struck until four months after the completion of the ring. Thus the least age of the concrete when first strained will be four months. The greatest stress caused at any point of the arch-rib when sprung freely off the falsework and only supporting its own weight will be 315 lb. per square inch. Including temperature changes the stress may reach 350 lb. per square inch.

The building of the vertical piers and secondary arches will then begin on top of the arch-rib. When the whole bridge including paving and balustrades, will be completed, but without the subway tracks and their supports, the greatest stress in the concrete of the rib will be 535 lb. per square inch, due to the fixed load. This cannot be done before a year's time from the date of the completion of the rib.

The total moving load on the upper deck will, in its position causing the greatest stress, bring the total compression up to 570 lb. per square inch. The effects of a change of temperature, shrinking of the concrete and distortion of the curve will increase this stress to 670 lb. per square inch. At least a year and a half will be required with the utmost speed of construction from the date of completing the rib to the opening of the bridge for traffic. Before that age of one and one half years the concrete in the rib will have an ultimate compressive resistance of at least 4,500 lb. per square inch, or 6.7 times the allowed unit stress.

Finally, when the subway tracks will be installed and trains be operated on the bridge the worst combination of all causes will induce a stress not exceeding 750 lb. per square inch at any point of the rib. The concrete at that time should have reached a compressive resistance of at least 6,000 lb. per square inch or three times the allowed unit stress.

It should be noted here that the greatet unit stress in the rib is not one due to direct compression only but represents a sum due both to direct and bending stresses. The resistance of concrete to such combined stress is 10 to 20 per cent. higher than to direct stress only.

The above discussion leads to the conclusion that, in view of the consideration given to all possible effects on the structure and the time required before the application of the full load, the adopted greatest compressive strain of 750 lb. per square inch on the concrete in the rib is well within the limits of safe construction.

Erection and Inspection.—The methods of erection to be followed in building the arch-rib, although generally planned, have not yet been worked out in detail. However, it may be stated that the arch will be erected on falsework resting in the river bed and thoroughly braced. Adjustments will be provided for all possible requirements during construction.

The proper design of the falsework is of great importance and it will be designed and detailed by the Department and will form a part of the contract for building the arch instead of being left to the contractor under the general approval only of the Department. It will be far better not to leave to the contractor to economize on the falsework or its careful design, but that the City pay for it the same as for any permanent part of the structure. Any improvements suggested by the experience of the contractor can always be incorporated afterwards.

After the completion of the arch-rib, it will be kept on the falsework for at least four months before striking the centers. During all this time the whole of the rib will be kept wet by a sprinkling system and be protected from the sun.

The inspection, including the testing of the materials, should be most thorough. A cement and concrete testing laboratory should be established on the building grounds in charge of a competent testing engineer. A testing machine of at least 500 tons capacity will be required for the work.

In addition to the usual experienced inspectors of masonary a corps of young graduate engineers should be employed to watch the work, all well organized under an engineer who should thoroughly understand all sides of the problem and the importance of every part thereof. A sufficient number of inspectors should be employed to insure the constant inspection of the whole job.

Concluding it may be stated that with careful design, careful selection of materials, thorough inspection and conscientious execution there is no reason why the construction of the Henry Hudson Memorial Bridge should not be brought to successful completion.

ELECTRIC TRAIN STAFF SIGNALS are to be used on two sections of the St. Louis & San Francisco R. R. near Birmingham, Ala.

A Study of Refuse Disposal.

On December 18, Mr. J. T. Fetherston, Superintendent of Street Cleaning of the Borough of Richmond, New York City, read a paper before the American Society of Civil Engineers on "Municipal Refuse Disposal; an Investigation," which gives the results of a very elaborate study of this subject, both its general principles and its special features in the borough. The full paper is printed in the "Proceedings" of the Society, vol. xxxiii., page 940, and a few of the statements in it were reported in this journal on December 8, 1906. The author made an elaborate study of the quantity, composition, seasonal variations and calorific value of the local household refuse, conducted tests by burning mixed wastes, and investigated many destructor plants. The information gathered by these means is given in detail in the paper.

The elaborate tables in the paper show that in the boroughs the volumes of the total collection during any month varies from 8 per cent. above to 12 per cent. below the average of 3.7 cu. yd. (or 1.6 tons) per thousand inhabitants per day, although the weight varies from 23 per cent. above the average in winter to 30 per cent. below it in the summer and fall. This weight variation is due to the different proportions of ashes, rubbish and garbage in the the different seasons.

Many tests of the compositions of the refuse and of the calorific value of the refuse and of its different parts are tabulated in the paper and from these data the accompanying table of the average fuel value of the refuse was computed. The figures for September are given separately, as the refuse during this month is more difficult to burn than that at any other portion of the year.

HEAT VALUE OF ONE POUND OF REFUSE.

Period.	Calorific Power of Combustible, B. t. u.	Moisture, Per Cent.	Ash, Per Cent.	Combustible, Per Cent.
Spring ...	4,747	14.03	50.06	35.91
Summer...	3,477	28.86	39.74	31.40
Autumn...	3,833	27.74	39.74	32.52
Winter....	4,358	13.11	52.72	34.17
Year	4,274	19.74	46.03	34.23
September.	3,265	35.83	33.69	30.48

Many tests of burning the refuse were made at a crematory on a grate of 12 sq. ft. area, and in spite of adverse conditions all tests but one were successful in destroying mixed household refuse, although unburned particles were at times found in the residue. The general results of these rough practical tests are summed up as follows:

1. Household refuse, as collected in this district, when burned in a properly designed furnace, will be self-combustible, under ordinary conditions, showing higher calorific power in winter than in summer. Screened refuse will give better results in burning than unscreened.

2. About 80 lb. of refuse per sq. ft. of grate could be burned before it became necessary to remove the clinker.

3. The process may be made continuous by retaining the heated coals from the top portion of the fire and removing the mass clinker. Coal may be required to heat the furnace walls if the operation of the plant is not made continuous.

4. The rate of burning will be higher in summer than in winter.

5. The percentage of clinker will also vary with the seasons, being high in winter and low in summer. The total residue was nôt determined, as a large portion of the fine ash was carried over by the air blast and could not be recovered.

6. The heat lost by the removal of hot clinker varied from 300 to 500 B. t. u. per lb. of clinker.

7. Street sweepings from this locality could not be burned with household refuse, except when mixed in small proportions.

From the data collected by his investigations and the information furnished by a thorough test of the destructor at Nelson, England, by Mr. C. E. Stromeyer, the author worked out a heat balance for the local refuse of which the leading deductions are given in the accompanying tables of the equivalent evaporation, from and at 212 degrees in pounds of water, and the estimated temperature of the combustion chamber, in degrees Fahrenheit, using the local refuse in a good destructor.

PROBABLE RESULTS WITH LOCAL REFUSE.

	Spring.	Summer.	Autumn.	Winter.	Year.	Sept.
Equiv. evap., lb.	2.46	1.29	1.68	1.98	2.03	1.02
Temp. deg......	2,370	1,710	1,950	2,140	2,150	1,550

Summarizing the results of examinations, tests, and experiments with mixed household refuse from the district considered, the following conclusions are derived:

1. Average local refuse differs mainly from what is known concerning average English refuse in the higher percentage of incombustible matter and the lower percentage of water. The average results to be expected in power production are surprisingly high, and the seasonal variations are greater with local refuse than with British refuse.

2. Under expert management, with a properly designed furnace, the process can be carried out in settled communities without nuisance.

3. The average local residue will be greater than the average English residue mainly because of the high percentage of fine ash which will to some extent be carried away from the fire-grate by the forced draft.

4. As compared with the local cost of burning garbage and caring for "ash and rubbish" dumps, the cost of the destruction of mixed refuse will probably be higher, though a proper utilization of the steam generated and the clinker resulting may offset this increase in cost, while a rearrangement of the refuse collection system may tend further to make the cost of the methods comparable.

5. For the particular condition herein considered, mixed-refuse destruction appears to offer the best solution of the problem.

Thirty-nine refuse destructors in Great Britain and one in Canada were visited by Mr. Fetherston, and his paper gives some elaborate summaries of the important facts concerning them. In comparing American household refuse with British refuse, localities having the same general characteristics and for the same period of the year should be chosen. On this basis, as a general conclusion, the author is of the opinion that British refuse contains more ashes, less garbage, less rubbish and more moisture than household refuse in the vicinity of New York. It would appear that no such seasonal variations occur as may be found in comparing American summer with American winter refuse, while, during the fruit season, British refuse contains no wastes comparable to melon rinds, and corn cobs.

That British refuse has a fuel value is proved beyond a doubt by the two hundred or more destructors in which refuse is burned throughout the year without additional fuel. There would seem to be no large seasonal variation in the calorific power of the material. The average evaporation for eighteen tests amounts to 1.62 lb. of water per pound of refuse.

The location of a plant for the final disposition of refuse has a most important bearing on the cost of the collection (including removal) of the material. Economy in collection requires that the plant shall be centrally located with regard to the district served, and that loaded collection wagons or carts shall proceed with the road gradient.

Of the forty destructors, four were critically located, so that the least nuisance would probably result in the abandonment of the plants; seventeen were centrally located in advantageous positions with regard to the district served, but the surrounding houses were not in close proximity to the destructors; nineteen were placed on the outskirts of towns and not likely to cause complaint, even if the plants were not well operated.

Complaints of nuisance due to the location of British refuse destructors in settled localities are said to be rare, and, as far as could be determined very few of the plants visited deserved condemnation in this respect.

All these destructors visited contain large brickwork chambers having fixed grates with boilers placed outside the refuse-burning portion. In the destruction of refuse by fire, well-determined principles of combustion apply. In practice, the destruction of refuse may be attained successfully by burning it by forced draft in a so-called Dutch oven or chamber where the brickwork is maintained at a high heat, and the escaping gases are subjected to a high temperature with an excess of air for a sufficient length of time to oxidize the combustible constituents of the material.

The forms of British destructors vary, and for convenience may be divided into two general groups.

Group 1.—The first may be termed the mutual assistance type, where one unit contains several grates with divided ash-pits, the products of combustion intermingling in the upper portion of the furnace, thus combining several furnaces or cells in one. Representatives of this type are the Meldrum and Heenan.

Group 2.—The second comprises furnaces in which each burning grate or cell forms a separate unit. The products of combustion either commingle in a general flue or combustion chamber, or pass directly from cell to boiler. Representatives of the cell type in which the products of combustion intermingle in a common chamber before passing to the boiler are the Horsfall, Sterling, and Beaman and Deas (Meldrum). Representatives of the type in which the products of combustion pass directly from the cell into contact with the boiler are the original Fryer, Fryer's Improved (Manlove-Alliott and Company), Warner, and Baker.

The Meldrum, Heenan, and Horsfall types pre-heat the air used for combustion to a temperature from 200 to 400° fahr. before it comes in contact with the burning fuel on the grate. Other makes of furnaces mentioned in Group 2 use air at ordinary atmospheric temperature. The utilization of heated air undoubtedly tends to more perfect combustion and higher temperatures both in cell and combustion chamber. Other differences in design, in the furnaces in Groups 1 and 2, may be noted, as for instance, the drying hearth which some furnace makers consider essential in the destruction of refuse, the use of steam-jet blowers or fans for forced draft, the different provisions for arresting dust, the kind of boilers used, the various methods of feeding, clinkering, stoking, etc. All the above-named destructors, except the original Fryer, use forced draft, which is considered necessary for the attainment of a high temperature.

The aim in the design of refuse destructors should be to maintain a steady temperature. If it be considered that 1,250° fahr. is the minimum at which septic poisons in the products of combustion are destroyed, the higher limit of temperature is fixed by the materials used in the construction of the furnace. Temperatures greater than 2,000° fahr. are apt to result in high cost of repairs. Thus temperatures between 1,250 and 2,000° fahr. are desirable, both from sanitary and economical points of view. As the burning of refuse in a destructor is an intermit-

tent process, requiring alternate charging and clinkering, the fluctuations in temperature should be minimized as much as possible. When destructors are of such design that the gases pass directly from cell to boiler without an intermediate combustion chamber, there is danger of unoxidized gases being cooled, by contact with the boiler, below the temperature required to prevent nuisance.

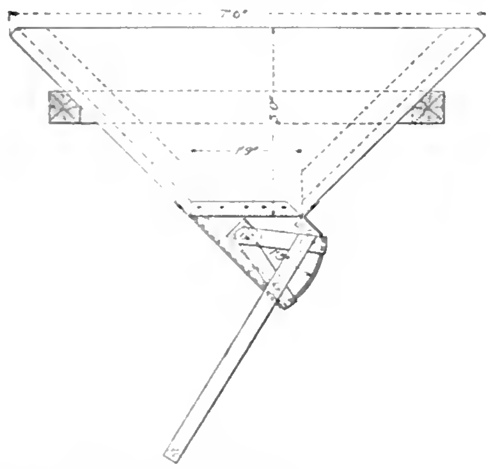
In general, modern British types of destructor vary in important details, and, of the different plants examined by the author, those in which a combustion chamber or flue was placed between the cell (or unit) and the boiler, and where heated air was used for combustion, appeared to be doing the most satisfactory work. Of the forty plants inspected, all but two produced steam for power purposes.

Cost of Operation.—The cost of operation was obtained from the engineer or superintendent in charge of the destructor or from the furnace makers. It appears that for twenty-four installations the average cost of labor per long ton (2,240 lb.) of refuse destroyed would amount to 24.3 cents, or 21.5 cents per short ton (2,000 lb.). As the American rate of laborers' wages is about double the British rate, this would make 43 cents per short ton of refuse destroyed on an American basis.

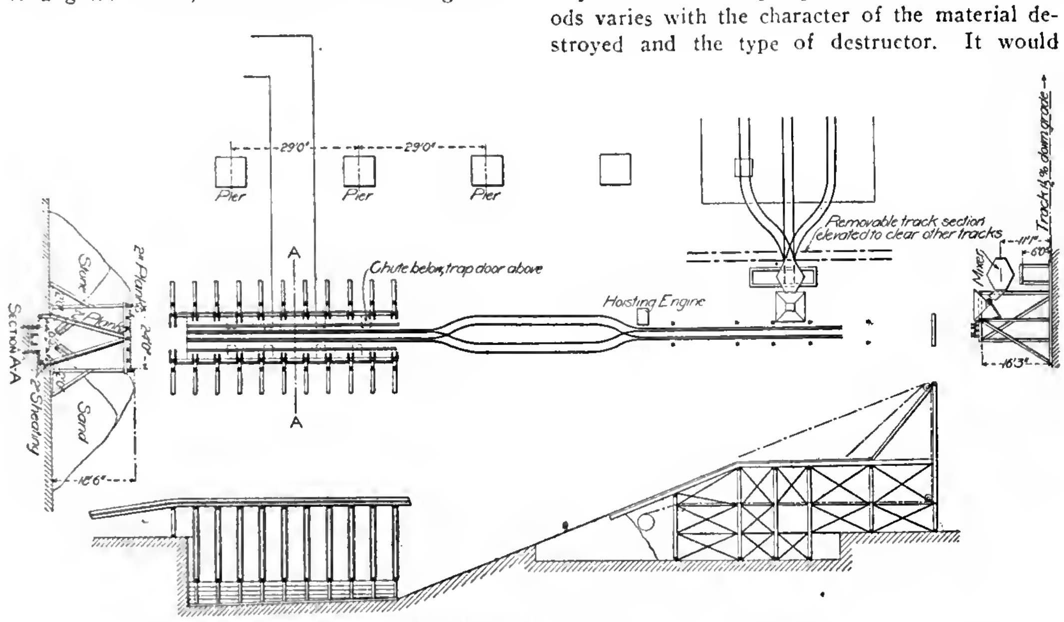
For supervision, only four installations had figures available, the average being 4.83 cents per long ton. Two plants reported the cost for repairs at 3.22 cents per long ton.

Only one complete report was obtained in which all charges for the destruction of refuse, including labor, supervision, interest on capital, sinking fund, repairs and supplies, were included. The total cost of operation, including all the above charges at Stoke-upon-Trent, amounted to $1.17 per long ton or $1.04 per short ton. By changing the labor rate so that it would compare with American conditions, and by assuming the same charges for interest, sinking fund and repairs, it would appear that the total cost of refuse destruction for a plant similar to that at Stoke-upon-Trent would amount to $1.50 per short ton in New York.

Definite information regarding the quantity of refuse handled per man per hour (assuming the quality of labor to be comparable) affords a better general means for arriving at the labor cost of operating a destructor. From the figures for twenty-seven plants, on an average, each man employed would handle 0.78 long tons per hour, varying from 0.5 to 2 tons per hour with the type of plant and method of operation. At an easy rate of working, there should be no difficulty in destroying 0.75 short tons per man per hour; hence, with wages at 25 cents per hour (or $2 per day), the cost of labor would amount to 33⅓ cents per ton, while at 31¼ cents per hour (or $2.50 per day), the cost would be about 42 cents per ton.



Charging Hopper, Manhattan Approach.



Concrete Plant of the Manhattan Approach, Blackwell's Island Bridge.

It appears that the top-feeding method (except where water-sealed doors are used) allows smoke to escape. Even with water-sealed doors, smoke escapes when charging. Of the hand-firing methods, the front-fed type appears to be advantageous, with regard to concentration of labor and freedom from escaping smoke, but the storage bin cuts off light and air from the firemen, while some refuse may be mixed with clinker if the men are careless. With back hand-feeding by shovel, ample light and air can be given on the clinkering side of the furnace where it is most needed. As compared with front-feeding, back hand-feeding does not permit of the same concentration of labor, but allows greater comfort to the men employed, which more than compensates for this slight disadvantage.

In general, shovel-feeding obviates escaping smoke from top-feeding doors, allows a better selection of refuse, and does away with stoking to a great extent, as refuse can be charged directly on the grate, thus saving one operation in destroying the material. When the refuse has not reached an advanced stage of decomposition, and does not contain an excess of water, or such objectionable material as nightsoil, hand-firing is undoubtedly to be preferred, especially for power plants.

By stoking is meant the dragging, pushing or spreading of refuse after it has been charged into the furnace. All top-fed destructors and all destructors provided with drying hearths require considerable stoking. Hand-fed types, without drying hearths, where refuse is thrown directly on the grate, do not need much stoking.

At first sight, it would seem that refuse charged direct from cart to cell without intermediate handling should prove most sanitary and economical, yet the disadvantages of this method are many. For any particular case, a study of local conditions will determine the best system to be used.

Clinkering is perhaps the most trying work in connection with the operation of a destructor. A mass of hot slag must be broken up by long bars, tipped into a wheel-barrow or other conveyance, and removed while in a highly heated condition. The work is performed by hand labor opposite the open doors of a highly heated furnace. There are various methods of conveying clinker, as by wheel-barrows, by cars on rails, or by skips running on an over-head rail. When cars or mono-railways are used, the storage room is limited, and the place where the material is deposited must be cleared at intervals; for this reason, the system has been abandoned in favor of wheel-barrows at many plants. Various mechanical devices, such as tipping grates, etc., have been tried in order to lessen the work of clinkering, but, up to the present time, all have failed.

As a general rule, the clinker in sight at the various installations was found to be hard and well-burned, except where plants were carelessly operated, or where fires were rushed at some electric lighting stations. In order that clinker shall be dense and that practically all the carbon shall be oxidized, it is necessary that the clinker be exposed to a high temperature for a sufficient time to consume thoroughly all the combustible material.

In burning mixed refuse, some fine incombustible material finds its way into the destructor flue or dust traps, and must be removed periodically. This may have an important bearing upon the actual capacity of a destructor, as it may be necessary to shut down the plant for several days while the cleaning process is under way. The time elapsing between cleaning periods varies with the character of the material destroyed and the type of destructor. It would appear to be necessary to clean out all flues thoroughly once every 4 to 6 weeks in Great Britain, except where a special dust-catcher is used.

Figures for eighteen destructor tests, giving the quantity of water evaporated per pound of refuse ("from and at 212° Fahr.") for periods varying from 6½ hours to one year were secured. The highest rate of evaporation was 2.66 lb. of water per pound of refuse, in a 15-hour run at a destructor in a colliery district. The lowest gave 0.88 lb. of water per pound of material, in a test of 11½ days, with refuse containing a large proportion of night-soil. The average evaporation in eighteen modern destructor tests amounted to 1.62 lb. of water per pound of refuse. In all the foregoing figures the water evaporated is a gross amount, and in order to obtain the net useful steam produced for power purposes it is necessary to deduct for forced draft apparatus. It appears, from the figures quoted, that, in a district where coal is abundant and cheap, it is possible to evaporate about 2.5 lb. of water per pound of refuse, while in other districts, distant from coal fields, destructors are capable of producing an evaporation of about 1.5 lb. per pound of refuse.

The Scrap Heap of the New York Edison Co. is a decidedly interesting affair. Moreover, it is a pretty valuable asset, for in 1906 the amount of scrap sold was approximately $200,000. The material included 632,000 lbs. of scrap copper, 350,000 lbs. of pig lead, 71,000 lbs. of mixed metals and approximately 500 tons of iron. This does not include the materials which were redeemed for further use.

Erection of the Manhattan Approach of the Blackwell's Island Bridge.

The double-deck approach to the Manhattan end of the Blackwell's Island bridge is a massive structure, about 1,070 ft. long, 120 ft. wide and 90 ft. in extreme height above the surface of the ground. Although really of plate girder construction, it is largely incased in masonry or terra cotta, designed to give it the effect of stone arches, as described in The Engineering Record of November 23. Except for a five-rib plate girder arch of 90 ft. clear span over First avenue the superstructure consists of 29-ft. plate girder spans seated on five longitudinal lines of vertical columns 30 ft. apart transversely.

The arch foundations were built in open pits, excavated through clay gravel, boulders and hard pan to solid rock at a distance varying from 20 to 35 ft. below the street surface. These foundations were sheeted with 2 and 3 in. square edge planks which were followed down by hand as the excavation proceeded. In places it was necessary to excavate as much at 5 ft. of decomposed rock before reaching a satisfactory foundation.

The column foundations, of which there are about 250, do not all extend to rock. The contractor was given the option of spreading the footing or continuing to rock. Part of these were sheeted same as the arch foundations and the shallower ones were constructed without sheeting.

The sub-structure including the retaining walls for the solid fill approach requires about 16,000 cu. yd. of concrete, besides about 10,000 yd. for subway roof, walls and other purposes, all of which is made in proportions of 1:3:6 and 1:2:4 using Giant Portland cement. An economical and efficient storage and mixing plant of large capacity has been installed by the contractor and is designed to make advantageous use of an old cellar on the site and to handle the concrete and materials as much as practicable by gravity. On the south side of the approach right-of-way, parallel to and clear of the rows of columns in the viaduct, a timber platform, 24 ft. wide and 47 ft. long, has been built over the cellar foundations on falsework bents 18½ ft. high above the cellar floor.

Under this platform there is an A-shape transverse frame with the vertex in the center of the roadway platforms just below the cross-girders and with the inclined posts entirely covered on the outer faces with 2-in. longitudinal planks, thus forming the walls of storage bins on opposite sides of the center of the platform. Four chutes inclined about 45 deg. to the vertical are set in both of the inclined sides of the bins with their lower ends clearing the tops of dump cars that travel between the bins on a narrow gauge track in a trench depressed 4½ ft. below the bottom of the bin. At the west end of the platform there is a plank incline to the surface of the ground on which wagons are driven up to the platform and dump sand and broken stone on opposite sides of it into the two large bins where they form piles of a total capacity of about 1,000 cu. yd. of stone and 500 yd. of sand resting on the cellar floor with their sides sloped at a natural angle of about 45 deg. on the exterior and retained by the inclined sides of the bin on the interior, thus storing about 200 cu. yd. on each side which can be discharged by gravity through the chutes leaving a residue of about 1,100 yd. which must be rehandled before it can pass through the chute. It is intended, however, to avoid the rehandling by reserving this excess portion for an emergency supply and to keep the bins filled to the level of the platform by constant supply wagons. By this means the lower part of the sand and gravel will be usually undisturbed and a gravity supply can always be drawn from the upper part unless the delivery of materials is unexpectedly interrupted.

On several occasions it has been found necessary to draw from the storage, but this has been done very economically by using a small slip scraper in the bin. It is operated by the niggerhead of the hoisting engine. Three men, one on the scraper, one signaling and one on the niggerhead handle as much as a dozen men with shovels.

Two 3-ft. gauge gauntleted trucks, are run between the sand and stone bins on a 1½ per cent. grade and at the east ends diverge to parallel locations 7½ ft. apart on centers and are carried up an incline of about 30 deg., to the horizontal mixing platform, built on falsework at a height of about 18 ft. above the original surface of the ground or 30 ft. above the bottom of the trench, where they are again gauntleted and run adjacent to a depressed charging hopper into which the cars containing the right proportions of sand and stone are dumped.

The steel side-dump cars of 45 cu. ft. capacity, water measure, were made by the Ernst Wiener Co., and are hauled up the incline by a wire cable operated through a sheave attached to the top of a braced mast rising 15 ft. above the mixing platform and wound on a single drum of a Lidgerwood hoisting engine located under the concrete platform at the east end and supplied with steam from a 40 h.-p. Nagle boiler.

Distributing Tracks above Concrete Moulds, Manhattan Approach of Blackwell's Island Bridge.

The concrete charging hoppers are about 7½ ft. square and 3 ft. deep, built of horizontal courses of planks nailed to 4x4-in. inside corner pieces and provided at the bottom with a segmental steel gate, 2 ft. long, operated by a horizontal hand lever. The contents of the hopper are discharged through an inclined steel chute 1½ ft. long to a No. 5 Smith mixer seated on a platform 6 ft. above the surface of the ground. The mixer delivers into two side-dump cars like those supplying stone and sand to the mixing platform. These cars run on surface tracks which will eventually be laid to all of the foundation piers. The first arrangement consisted as shown in the diagram of parallel transverse lines carried over the pits or one row of piers and over the trench for the abutments of the arch-span. The deepest pit will be about 35 ft. deep and as the concrete is dumped directly in them by reversing the car they are rapidly filled, over 275 cu. yd. of concrete from a single mixing machine being deposited in one 9-hr. day soon after the plant was put in operation.

The average nine-hour output up to November 1 was over 200 one cu. yd. batches. The maximum was 277. In one-half day an average of 33 batches an hour was maintained. These averages were also maintained while depositing concrete on the river side of First avenue, which meant mixing the concrete on one side of the street and transferring across to the other on an elevated structure. The car for the transfer was operated by a single-drum engine and was so arranged as to make the round trip in 1¾ minutes. When across the street it dumped into other cars for distribution.

Concrete for the piers at the west end of the viaduct will be delivered in buckets carried on flat cars, and will be handled by the traveler designed for the subsequent erection of the steel work The traveler has a 35x35-ft. horizontal timber platform running on three single lines of rails 18 ft. apart, the center one being near the axis of the viaduct. Each front corner of the platform carries a 30-ft. mast and a 50-ft. boom of 5 tons capacity, operated by a Lidgerwood hoisting engine and a Rawson swinging engine, supplied by an independent steam boiler. The dimensions of the traveler and the location of its track are such that it can serve 10 foundation piers or erect 5 viaduct columns from one position.

As it was specified that 3½ cu. ft. of sand or crushed stone should be equivalent to one barrel of cement, great care was taken to provide for the accurate measurement of the sand and stone used in the concrete. A wooden box, 18 in. square and 24 in. deep, was provided, filled with sand and shaken down from 23 1-16 to 18 11-16-in. Three measures of sand were thus prepared and filled in the hopper and carefully leveled and gauge marks made to indicate the height required on the sides of the hopper. The box was then filled with stone and shaken down from 20 15-16 in. to 18 11-16 in. and 6 boxes of stone were filled in the hopper and the gauge marks adjusted as before after which four bags of cement are added for each batch of 1:3:6 concrete.

Operations were commenced June 22, 1907, and a total force of about 200 men is now employed. Giant cement is used for the concrete, and over 7,000 cu. yd. have been laid to date. It is expected that the erection of the steel superstructure will be commenced about January 1, 1908. The excavation is nearly completed and amounts to a total of about 35,000 cu. yd.

The bridge was designed and its construction supervised by the Department of Bridges of New York, Mr. J. W. Stevenson, commissioner; Mr. C. F. Ingersoll, chief engineer; Mr. O. F. Nichols and Mr. Albert Lord Bowman, consulting engineers. The contract for the construction of the Manhattan approach was awarded to the Snare & Triest Co., Mr. J. C. Hain in charge of construction. The structural steel will be furnished by the Pennsylvania Steel Co.

The Southwest Pass Jetties at the mouth of the Mississippi River were completed this week, and after some dredging between them is finished work on this important waterway will be ended, after four years of construction and the expenditure of about $[illegible]. The jetties are about 3½ and 4 miles long and over half a mile apart. They are expected to produce a channel with a minimum depth of 35 ft. and a width of at least 1,000 ft. and have already caused a great improvement over most of the route of the channel. Each jetty is a pile of mattresses of scantling and brush, like those for bank protection, along the Mississippi. The top mattress is 35 ft. wide and the pile is 6 to 15 ft. deep. A massive concrete [illegible] on each jetty rises a little above the water.

Internal Combustion Motors in Municipal Plants.

The increased favor shown internal combustion engines for driving small pumping and lighting machinery has been rather marked during the past year. The late Freeman C. Coffin was one of the first engineers to use such motors in small water-works in New England, and for a time he was probably the leading believer in them for such service, although in the Western States they were long ago introduced on many farms for pumping water for irrigation, which was the natural result of their earlier use for other purposes on some of the large farms in that section of the country. At the present time there is considerable diversity in the plants, as the following notes on some recent installations will show.

Among the small water-works plants recently constructed in Massachusetts, there are three built from the plans of Mr. Edmund M. Blake, of Boston, that are unusual. The first of these is that of the Westford Water Co., which draws its supply from a number of driven wells and distributes it through about 8 miles of mains. There are two distribution districts, for high and low service respectively, with two standpipes, presenting an unusual load condition for the pumping station. This has a 50-h.p. Pintsch suction gas producer, a 50-h.p. Olds horizontal gas engine and a heavy-duty Platt triplex pump. This is one of the few pumping stations in New England to run on producer gas.

The plants at Wareham and Wrentham designed by the same engineer also pump water from driven wells into standpipes, but the engines in this case are Mietz & Weiss fuel oil motors direct-connected to Platt triplex pumps. At Wareham there are two 25-h.p. engines while at Wrentham there is but one. The Wareham plant has a single shaft with the two pumps in the middle and an engine at each end. The pumps are 8½ ft. apart on centers and the engine is 6 ft., 11 in. from the nearer pump, center to center. There is a clutch between each engine and the pump shaft so that either engine may drive either pump. The maximum head against which the pumps operate is 350 ft.

These engines run on fuel oil which is sold at about 4½ cents per gallon. The type of engine was described in The Engineering Record when it was first brought out, but since that time a number of improvements have been made, particularly in the steam details for the purpose of allowing low grades of crude oil to be employed without causing excessive deposits in the cylinder. The steam generated in the water jacket goes to a steam dome and thence to a port in the cylinder, where it enters with the air and mixes with the oil vapor in the cylinder to form the charge. This makes it possible to run with a somewhat higher compression pressure on account of the lower temperature with the steam mixture. With ordinary fuel oil of 20,000 B. t. u. per pound, the oil consumption with these engines is stated to vary from 0.86 to 1.25 pints per horse-power-hour, the maker's guarantee being 1 lb. per horse-power-hour. About 2 pints of water per horse-power-hour are used. The temperature in the jacket is stated to vary not over 5° from full load to no load. The governor is now of the high-speed steam-engine type, changing the throw of the eccentric which operates the oil pump by the centrifugal force of a weight acting against the spring.

A new plant recently installed for electric lighting at Ottawa, Kan., is specially interesting because it takes the place of a former steam-driven plant. The latter was installed in 1903, but when the Kansas Natural Gas Co. ran a pipe line into the city an opportunity to drive a good bargain for municipal power was seized. The franchise granted the gas company provided that the city can have gas for steam purposes at 10 cents per 1,000 cu. ft. and for engines at 12 cents. The company claimed that the great economy of gas engines as compared with the amount of gas used in raising steam under boilers would curtail its revenues were the former used and it held out for the higher price for gas used in internal combustion motors. The gas averages about 900 B. t. u. per cubic foot. The authorities burned the gas under the boilers of their old plant for nearly a year, but finally became convinced that a gas engine was the thing to use and accordingly bought one of 125 h.p. from the Weber Gas Engine Co., Kansas City. This is a vertical three-cylinder machine driving a 75-kw. alternator by belt. It was tested on Oct. 2, 1907, for 12 hours, current being supplied to the regular service and the surplus at the heavier loads being absorbed by a water rheostat. The engine was started at quarter load which was increased to 10 per cent. over the rating of the engine. The maximum load was 103 kw. During the 12 hours the total output was 1,020 kw.-hr. and 20,500 cu. ft. of gas was consumed, the cost of fuel per kilo-watt-hour being 2.4 mills, about one-fifth of the fuel expense when the gas was burned under the boilers of the old steam plant.

The operation of the sewage pumping plant at Newton, Mass., described in this Journal on June 11, 1904, furnishes information concerning what may be expected of small gasoline engines running intermittently. This outfit consists of two 6-h.p. Fairbanks-Morse motors driving a horizontal shaft from which a pair of submerged centrifugal pumps with vertical shafts are driven by bevel gears. The engine is run on 72° gasoline which has cost about 16 cents per gallon on the average, and it is estimated that the cost of pumping per million gallons raised 1 ft. is about $1.35, of which 58 cents is the cost of the fuel. According to Mr. Irving T. Farnham the plant as a whole has performed the service for which it was designed very satisfactorily, and the troubles, such as they were, have been due to other causes than difficulties with the engines except in connection with the electric igniters. The trouble in this case seemed to be with the apparatus for shutting down the motors when the pumping was to cease, and was remedied by a redesign of the apparatus.

About ten years ago the late Freeman C. Coffin designed two sewage pumping plants for Charlottetown, P. E. I., which have been in continuous service ever since it was installed. According to some statements recently made by Mr. Lewis D. Thorpe at a meeting of the Boston Society of Civil Engineers, each plant consists of a 7-h.p. Otto gas engine belted to two centrifugal pumps in a collecting reservoir. The engines are started up by hand when enough sewage is collected in the reservoirs to make pumping necessary, but they are stopped automatically when there is no more work to be done, and the same simple apparatus shuts off the supply of cooling water and drains the jacket. The gas required to pump a million gallons 1 ft. high costs from 20 to 27 cents, while the amount of attendance required is nominal.

Panama Canal Excavation during November exceeded all previous records, amounting to 790,632 cu. yd. on the Culebra division, 44,044 cu. yd. on the Chagres division, 121,635 cu. yd. at the Gatun locks, 40,987 cu. yd. at the Gatun dam and spillway, 8,190 cu. yd. on the La Boca division, 40,003 cu. yd. on the Colon division and 792,995 cu. yd. by dredging, a total of 1,838,486 cu. yd. The reports indicate a continued improvement in sanitary conditions, and no yellow fever has occurred for eighteen months. The annual death rate among employees is now 20.66 per thousand. It has been announced that medals will be given to all citizens of the United States serving two years satisfactorily on canal construction.

The Fish Freezing and Storage Plant of the Consolidated Weir Co., Provincetown.

By Howard S. Knowlton.

The Consolidated Weir Co., of Provincetown, Mass., operates a large fireproof fish-freezing warehouse on the shore of Cape Cod Bay about half a mile east of the business center of the town. The warehouse and a new power plant in connection with it have recently been completed, under the design and supervision of Mr. F. W. Dean, of Boston, mill engineer and architect. The equipment illustrates the dependence of the modern local fishing industry upon mechanical methods, beginning with the motor boats used in collecting catches from the weirs in the harbor and concluding with artificial refrigeration for the preservation of the fish in the warehouse.

The plant consists of a main building, 70 ft. square and five stories high, with elevator and conveyor, and an adjoining power house, 60 x 40 ft., containing boilers, engines and refrigerating equipment. Three floors are used for fish freezing and storing, one for fish receiving and distributing, and one for cooperage. The whole arrangement was planned to reduce insurance, depreciation, repairs and attendance as much as possible. The power house is designed not only to contain new machinery, but also some old refrigerating and power equipment used in connection with an old plant. The new power house and warehouse are both of reinforced concrete. The pilasters, girders, beams, columns and floors are of reinforced concrete, with panels of hollow concrete blocks laid in cement plaster. The window sash is galvanized iron glazed with wire glass. The inside surfaces of the walls on the first three stories are insulated with 4 in. of nonpareil sheet cork cemented on, with hard cement finish on the inside.

On the top of the first, second and third floors there is 4 in. of cork insulation, with a 3-in. top cement finish. All floors have a granolithic wearing finish, and the fourth or assorting floor is waterproofed. The fifth floor is used for cooperage, the fourth for receiving and distributing, the third for sharp freezing, and the first and second for storage. The doors leading into the freezing rooms are the Stevenson special freezer door, covered with galvanized iron. Stevenson cooler doors are used between air locks, the stair tower and elevator well. All other insulated doors are metal covered, and in angle iron frames. Scuttles are provided in the second and third floors for passing goods through to the floor below, these having insulated covers set in angle iron frames.

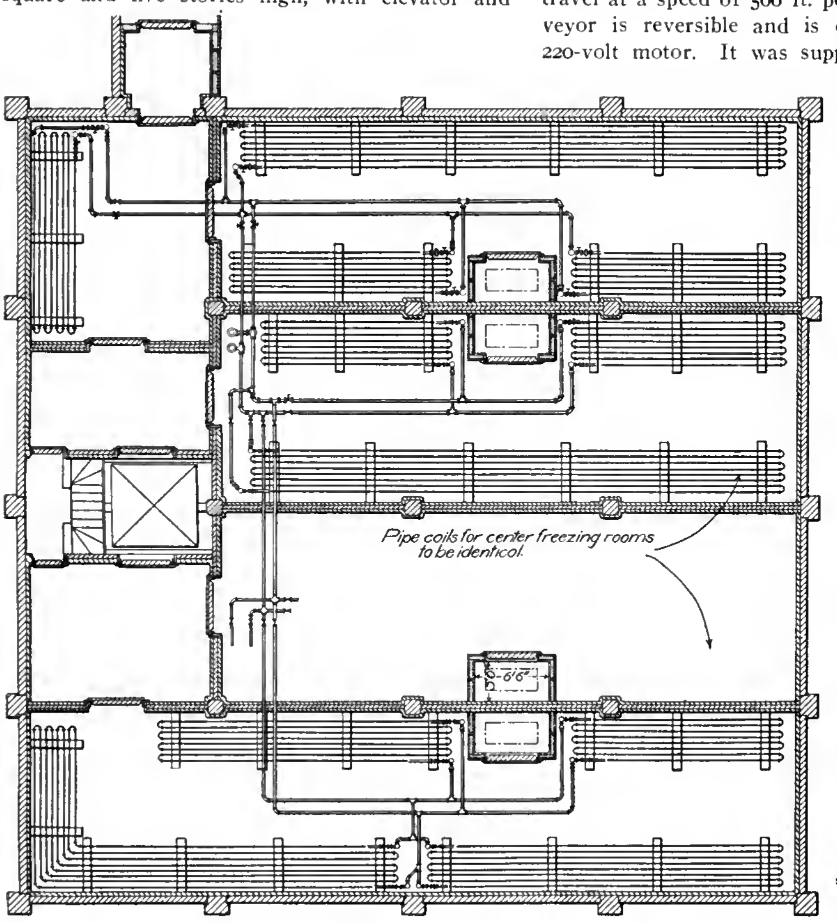
The power house is of the same general construction as the warehouse, with panels of concrete blocks. The roof is designed to carry part of the refrigerating apparatus and is waterproofed with granolithic finish.

Fish are received at the wharf about 500 ft. south of the freezer and are here cleaned or delivered directly into conveyor buckets. These are 2 ft. by 2 ft. by 30 in. in dimensions and travel at a speed of 500 ft. per minute. The conveyor is reversible and is driven by a 10-h.-p. 220-volt motor. It was supplied by the Coburn Trolley Track Company and is carried on spruce poles spaced 16 ft. apart. It rises from the wharf to the fourth floor of the freezing building by an incline 130 ft. long. Inside the building at the fourth floor level are two loop tracks, around which the buckets are operated by hand, as conditions require. The conveyor is of the traction rope type, and the buckets travel in a straight line. At the wharf a switch is provided to enable buckets to be stored at one side.

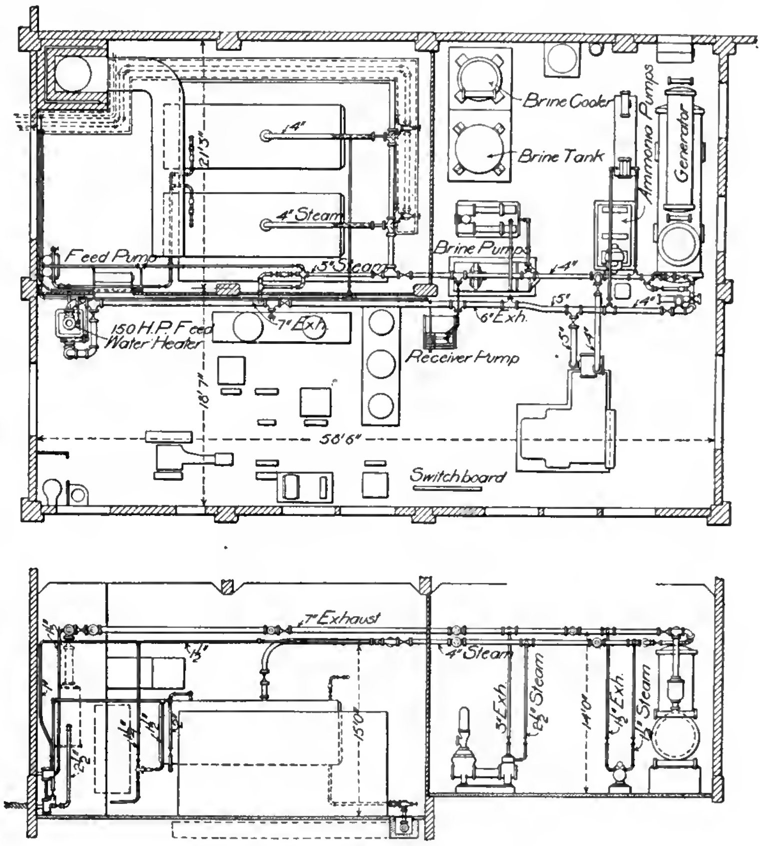
The boiler room is about 21 x 33 ft. and contains two 66-in. Bigelow horizontal return tubular units rated at 110 h.-p. each and operated at about 100 lb. steam pressure. Each boiler discharges into a common flue 2 ft. 9 in. by 2 ft. 7 in. in section, which leads into the uptake of an iron stack 3 ft. in diameter and 85 ft. high, that rises from one corner of the room to a point above the top of the building. A 6 x 4 x 7-in. Warren vertical feed pump is installed in the boiler room, and this delivers to the boilers through a 2-in. line. A 150-h.p. Cochrane feed water heater is installed in the engine room, and this is served with the exhaust steam of all the auxiliary pumps in the plant through a 7-in. line running the entire length of the engine room in decreasing sizes. Hand firing is, of course, employed.

The refrigerating and steam plants occupy the entire engine room, which is walled off from the boiler room. The engine room is large enough to contain an old refrigerating equipment of 20 tons capacity. This and the new refrigerating apparatus was supplied by the Carbondale Machine Co., of Carbondale, Pa. The new and the old plants are tied together, so that when desired each can help the other.

The new refrigeration apparatus consists of a 40-ton absorption-type equipment, with brine circulation. The condenser, atmospheric absorber and rectifier are placed on the roof of the engine room. Steam is taken from the central parts of the boiler shells by a quarter-turn 4-in. connection delivering into a 4 to 5 in. header. Before leaving the boiler room the header delivers into a 3-in. branch line carried to supply the old refrigerating equipment and the feed pump. A bypass with reducing valve is provided in the connection with the old machinery. The 4-in.



Piping in Freezing Room.



Steam and Exhaust Piping.

steam header is carried in a straight line about half way through the engine room, branches being taken off for the pumps and electric generator set. The ammonia system generator is supplied by a 3-in. connection. This generator is of the horizontal type and is operated at not over 10 lb. pressure through a reducing valve, ordinary operation being at 5 lb. or under. It is 39 in. in diameter and 14 ft. long, containing two steam coils. This low-pressure operation is a distinct departure from earlier practice and in the direction of better economy. The refrigerating apparatus is capable, with an initial temperature of condensing water not over 60° F., and with steam at not over 10 lb., of cooling 112.8 gal. of calcium chloride brine for 24 hours from 0 to 10° F.; the specific gravity of the brine being 1.240. The brine cooler is of the Hendrick type, 9 ft. high and 3 ft. in diameter. Two brine circulation pumps are installed, one being a Warren 12 x 8½ x 12-in. steam-driven duplex unit and the second a Lawrence two-stage centrifugal pump driven by a 10-h.p. motor. Each pump is rated at 300 gal. per minute. The steam supply of the Warren brine pump is drawn from the engine room main

through a 2½-in. line. The engine room also houses a brine-storage tank 4 ft. in diameter and 11 ft. high, fitted with perforated plates at the top for the charging process with calcium chloride. Either brine pump is capable of handling the entire circulation necessary in the refrigerating coils.

The ammonia circulation is handled by one or both of the pumps in the engine room. One is a 12 x 5 x 12-in. single Warren pump, steam operated through a 1¼-in. supply line, and the other a 3½ x 8-in. triplex pump driven by a 7.5-h.-p motor. The ammonia circulation starts at the generator in the engine room, passes through the analyzer to the rectifier and condenser on the roof, returns to an anhydrous receiver in the engine room, passes through the expansion valve to the brine cooler and then goes to the absorber, ammonia pump, exchanger and analyzer, back to the generator. All the ammonia piping is extra heavy lap-welded wrought iron.

Circulating and feed water for the plant is drawn from eight 8-in. wells 20 ft. deep, located beneath a pump house about 450 ft. from the power house. Each of these wells delivers into a 4-in. line, which joins the other 4-in. lines in a 5-in. lead that discharges into a sand chamber located centrally in the pump house. The 5-in. suction line of an 8x10-in. triplex pump is connected to this chamber, which is 30 in. in diameter and 6 ft. long. The pump is driven by a 20-h.-p. motor. A 3-h.-p. motor and air pump are also provided in the house to assist in the maintenance of a vacuum in the suction chamber. A 6-in. cast iron main connects the pump well with the power house, and a branch connection to the town water supply is provided. Strainers 8 ft long are used in the wells.

The current used in the establishment is furnished by a 62.5-kw. 220-volt Westinghouse direct-current generator direct connected to a 12 x 12-in. Skinner engine operating at 300 r. p. m. having a 4-in. steam supply, and a 5-in. exhaust. An old 110-volt generating unit is still available for service in connection with the old equipment, but all the new motor-operated machinery is driven by the 62.5-kw. unit.

All the principal steam-consuming units are connected to an exhaust main which traverses the power house longitudinally, increasing in diameter from 4 to 7 in. as it approaches the feed water heater. The exhaust main is also provided with an atmospheric outlet, a relief valve protecting the system from excessive pressures. The old refrigerating apparatus is also equipped to discharge through the feed-water heater.

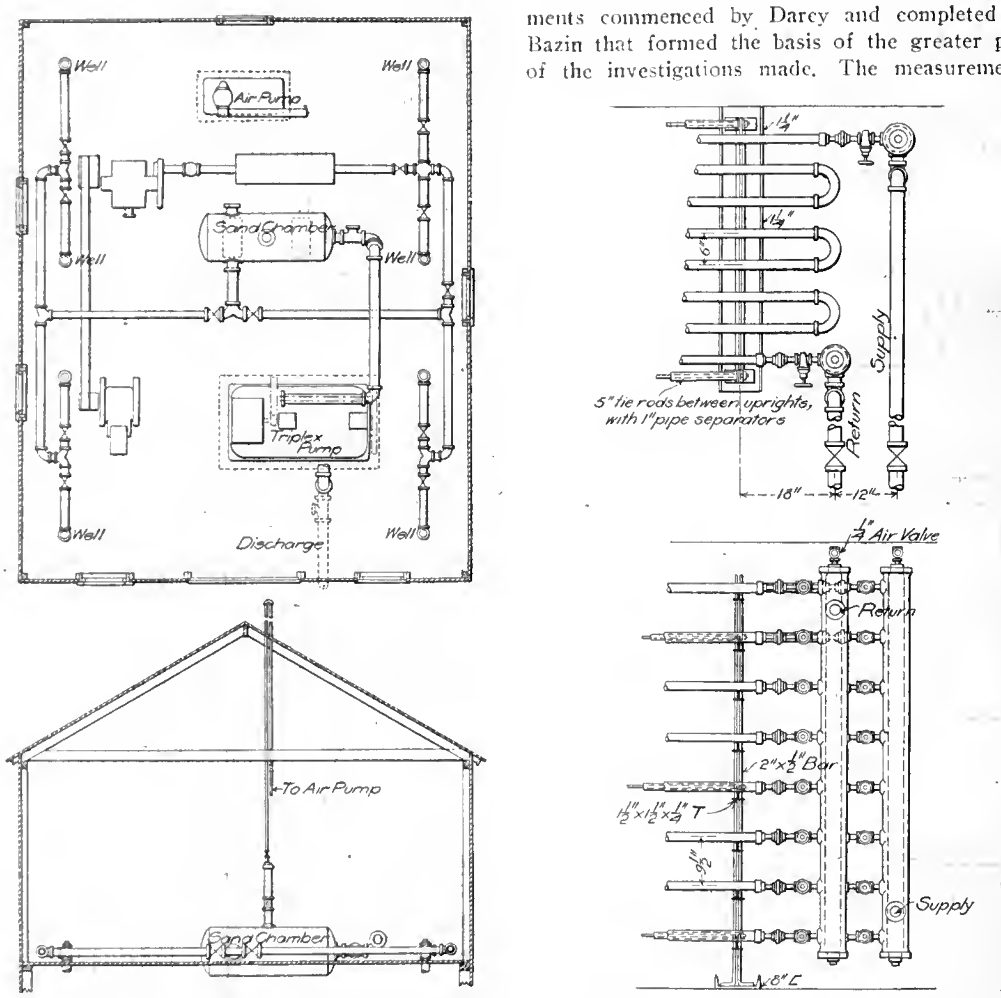
The accompanying drawing shows the arrangement of brine coils in the fish freezing rooms on the third floor of the warehouse. This floor is divided into five compartments for separate refrigeration, but only four are in use at present. All coils are of 1¼-in. pipe supported on galvanized channel iron racks. A vertical space of 9½ in. between centers is allowed for the placing of fish pans. In general, the supply and return mains for each chamber are 2½ in. in diameter, the coils being located on the opposite sides of the room, with separate valves for each section. The coils are connected in multiple, so that the operation or stoppage of any set will not affect the flow of brine through the others. All piping and supports in freezing rooms are galvanized. Air locks are installed to prevent the direct opening of any cold chamber to the external atmosphere. A 4,000-lb. Salem electric elevator driven by a 10-h.-p. motor and fitted with the Richmond safety gate serves all the floors of the warehouse.

THE SHRINKAGE OF WOOD from loss of moisture has been found by the U. S. Forest Service to range from 7 to 26 per cent. of the dry volume in different species.

Flow of Water in Open Conduits.

By A. P. Merrill, Salt Lake City, Utah.

In their evolution, the principles of what we term "hydraulics," like other branches of applied science, have been variously modified and changed in order that they may be made to conform with observed facts. Galileo was probably the first to turn his attention to this subject, and some of the theories he advocated are amusing in the light of modern knowledge. It was about the middle of the eighteenth century when Brahms and Chezy proposed the well-known formula, $V = C\sqrt{RS}$, and it has been very extensively used since that time. The coefficient, C, was at first supposed to be a constant, but as time advanced and experiments began to be made, it became evident that the expression must be modified.



Water Supply Station and Typical Coil Details, Fish Freezing Plant.

It is a little curious that many of the investigators have accepted, without question, the relation between the velocity, the hydraulic radius and the slope as proposed by Chezy, and have turned their attention to the coefficient, C, aiming to find some law by which it might be varied. The most noted of these are Ganguillet and Kutter, and it is the law proposed by them for the variation of this coefficient that is most extensively used to-day. This expression, while somewhat cumbersome, has been made quite easy of application by the various diagrams now in use. But is the general law with which Kutter's coefficient is used, correct? While the expression proposed by him is recognized by all as being very ingenious, and while the mathematical skill required in its development is no doubt beyond that possessed by many, yet if the Chezy formula does not involve the true law, then Kutter's proposed equation for the coefficient is merely a mechanical device designed to enable us to approximate the truth when applying a law which does not express it.

It was while the writer was working for his Master's degree at the University of Michigan that Prof. Gardiner S. Williams proposed the subject "Flow of Water in Open Conduits" as a suitable one for a thesis investigation, and the suggestion was gladly accepted. In studying this subject, the writer aimed to cast aside all preconceived notions as to what the various relations should be, and when the results obtained suggested a new working hypothesis, he did not hesitate to try it. This meant that much work was done on assumptions that were erroneous, and were necessarily discarded. The discussion presented here is merely a brief outline of some of the matter presented to the University of Michigan in the thesis referred to.

It was the results of those admirable experiments commenced by Darcy and completed by Bazin that formed the basis of the greater part of the investigations made. The measurements recorded in forty-one of their tables or "series" were used. They were taken from "Hydraulics," by Hamilton Smith, Jr. The general conditions under which these results were obtained, and the methods of experimentation, are too well known to need special comment here. Measurements were also used which were made on the Sudbury Conduit by Fteley and Stearns, on the Linth Canal at Grynau by Legler, on the Seine at Paris by M. Poiree, on the flume of the Puget Sound Power Co., in Pierce Co., Wash., by Jos. H. Cunningham, and on the flume of the Ulysses Heat, Light & Power Co. at Taughannock Falls, N. Y., by Messrs. Bell, Goodrich, Haefner and Thompson. Besides these, there were results used that were taken from the Roorkee Experiments by Capt. Allan Cunningham, and also some made by Rittinger.

Most of these last-named measurements were taken from Hering and Trautwine's translation of "Flow of Water in Rivers and Other Channels," by Ganguillet and Kutter. The measurements on the flume in Pierce Co., Wash., are found in the Trans. Am. Soc. of C. E., Vol. 55, p. 252. The ones made on the flume at Taughannock Falls were taken from some field books now on file at Cornell University. This work was the subject of a thesis presented to that

school, and it was at the request of Prof. Williams that the field notes were loaned to the writer.

Before outlining the steps taken in this investigation, reference is made to an article in the Journal of the American Society of Naval Engineers, Vol. 5, by William F. Durand, entitled, "Analysis of Certain Curves Arising in Engineering Investigations." This deals particularly with the meaning and use of logarithmic curves, and, as there is considerable literature on the subject, it is assumed that it is too well known to justify a special discussion here.

If we apply the priciples of work and energy to a given case of uniform flow in an open channel, we are readily led to expect that the laws governing it would involve some sort of relation between the mean velocity, the hydraulic radius, and the slope. If one assumption were made, viz., that the frictional resistance opposing the flow varies as the square of the mean velocity, it is well known how the principles referred to verify the Chezy formula. But in making this assumption we are applying to a viscous fluid a principle which is verified only by rigid bodies. Probably in each special case there may be found in some particular point in the cross-section of the stream, some velocity that would verify the assumption, but without experimental proof we are at a loss to tell where it is, if it exists at all.

In any given canal the bottom slope is fixed, and, theoretically, for the case of uniform flow it would be parallel to the surface slope. This was recorded as being the case in the greater part of the data studied. This meant, therefore, that each table of results contained but two observed variables, the mean velocity, and the hydraulic radius. To form a working hypothesis, it was assumed that V varied as R^x or $V = ZR^x$, Z being regarded as a constant for the present. If we place this in the form Log. V = Log. Z + x Log. R, we at once recognize the form of the straight line equation with x as the slope. It was on this basis that the first part of the investigation was made. In plotting, the writer preferred using the logarithms of the variables, rather than plotting the quantities directly on logarithmic paper.

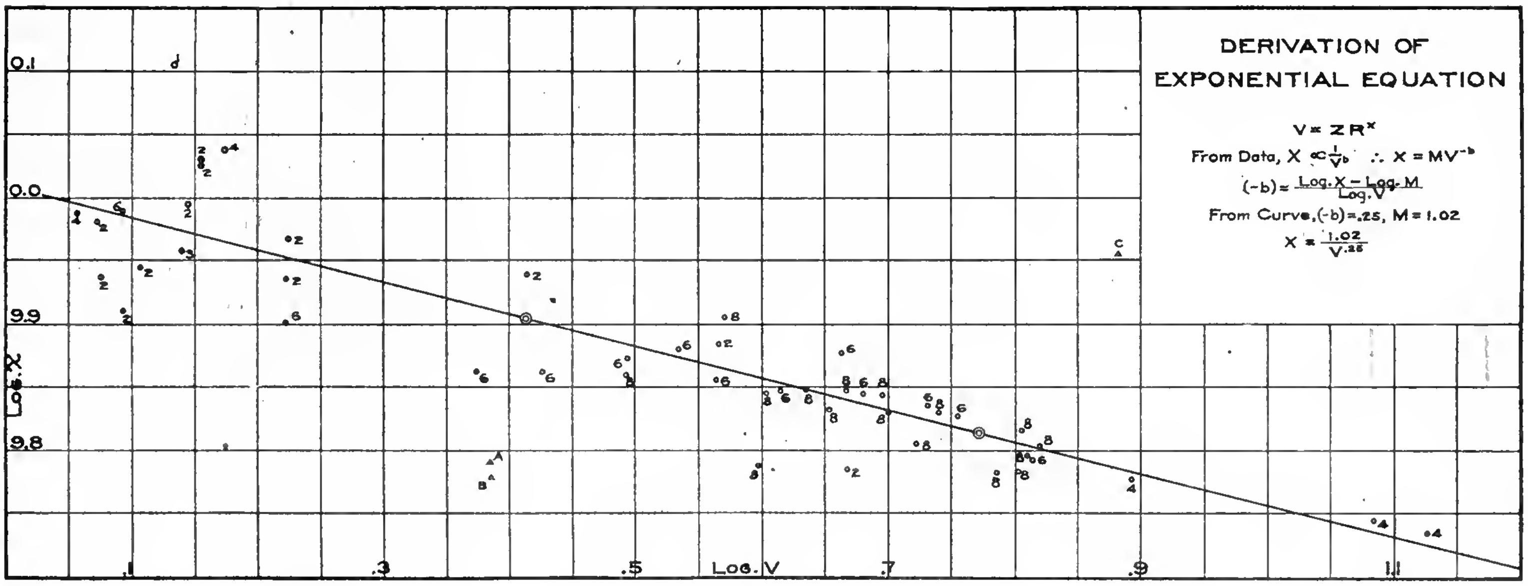
If the assumption made is correct, the locus of the points plotted as indicated above would be a straight line, and, without exception, the data in all of the 52 tables verified it. It might appear that the principal reason for making the plottings was to determine numerical values, either for the slope or some constant in the equations considered. However, the chief reason for making them was to disprove or verify the working hypothesis, to determine the value of the data as a whole or the relative value of the individual measurements in the table, and, roughly, to furnish a check on the numerical work. The plottings were used as a basis in assigning weights to the individual measurements, and the locus was determined by two points of the same weight calculated from the data itself. It was the numerical values which determined the location of these two points that were used in calculating the slope, or the constant in the equation.

Of course each table plotted furnished a numerical value for x. The results were somewhat surprising. Instead of being about constant, as was originally anticipated, they varied through such a wide margin that the writer began to suspect that the variation might be in accordance with some law. Various hypotheses were tried, but, being inadequate, were discarded. The suggestion as to what the law might be was furnished when a comparison was made between the results given by the measurements made in the flume at Taughannock Falls, N. Y., and those in the flume in Pierce Co., Wash. In the former case, the average velocity for the series was close to one foot per second, while the exponent, x, was comparatively high, and in the latter, with an average velocity of about 12 ft. per second, the exponent was the lowest obtained. This consideration was the foundation of the assumption involved in the development given on the diagram submitted. The values of the velocities, the logarithms of which are plotted on this diagram, are the averages of the values given in the table from which the corresponding value of x was obtained. The figure given at each circle indicates its weight, the number of readings from which the numerical values of x and V were derived, and the value of the readings as a whole as indicated by the plottings, having been used as a basis for assigning it. The double circles are the ones which gave the direction of the line, the numerical values having been computed as indicated above.

Attention is called to points a, b and c, on the diagram. If the law laid down for the variation of the exponent is sufficient, then it is necessary to find some explanation for the apparent contradiction indicated by these points. However, the canal in which the measurements were made which determined the location of point c had a fall of 24.6 ft. per thousand. This, of course, means that the conditions required for what we term uniform flow did not obtain in this case, and as the hypothesis did not provide for the elimination of the increased velocity head, the location of this point is nothing beyond what would be expected.

Points a and b were located by the results obtained from measurements on the Sudbury Conduit, and which were made by Fteley and Stearns. By plotting the readings given, it was seen that the measurements were quite uniform, and unless there was some constant error which affected all of the readings alike, it appeared that no better results could be desired. As yet the writer has not had an opportunity of studying in detail the methods or general conditions of experimentation in this case, so he withholds any attempt at this time to explain this discrepancy. Points a, b and c were not used in determining the direction of the line.

While the uniformity of the results indicated by the circles on this diagram is not all that might be desired, yet there is no doubt as to the general tendency. The points at the extreme left vary through a rather wide margin, but this is not surprising when we remember that the experimenters themselves did not regard these particular measurements as being much more than an approximation. Most of these observations were made on the Grobois canal. After considering that the results on the diagram submitted were obtained from observations made under widely varying conditions and by different people, the writer is fairly well satisfied with the evidence supporting the assumption regarding the exponential variation.



An inspection of the original equation, Log. V = Log. Z + x Log. R, shows how, for each value of the slope, a corresponding value for Log. Z could be obtained, for when Log. R = O, Log. V = Log. Z. These values were determined originally but, at that time, the author did not anticipate a variable exponent. The whole process being tentative anyway, it was thought well, after the equation for x had been determined, to compute, for each reading in the tables, a value for Z from the equation $V = ZR^x$. In these calculations the values of x were read directly from a curve given by its equation. This made the process quite simple as, in this case, the measured velocity was known.

After the computations just indicated were completed, an examination of the results showed that Z decreased quite uniformly as the velocity increased in the case of the smaller channels, while it increased with the increase of velocity in the case of rivers and very large canals. This again was somewhat surprising, as it was expected that the variation in the exponent, x, would counteract this tendency, and that the final formula would be obtained by merely substituting for Z the symbols, $CS^{1/2}$. But the full story was not to be so easily obtained, so as a further working basis it was assumed that $Z = K' V^{-n}$ in the case of ordinary channels, while for rivers and large canals, n would be positive. In order to verify this assumption, if true, and to determine numerical values of n and K', the values of Log. Z and Log. V were plotted and the locus

drawn. Of course space would not permit showing the resulting diagrams here, but, while the points were not quite as uniform as those obtained when Log. V and Log. R were plotted, yet evidence supporting the hypothesis was, as a whole, quite satisfactory.

If n varies, numerically, from positive to negative values, we would naturally ask, What is the size of conduit which would make $n = 0$? While the results of the measurements in the flume at Pierce Co., Wash., gave such a value, the width of which was approximately 8 ft., the writer does not regard the evidence sufficient upon which to base any general conclusions.

When the numerical values for n and Log. K' were collected, it was found that, with one exception, n did not vary through a very wide margin for the rectangular and miscellaneous conduits, such as used by Darcy and Bazin, and that Log. K' was nearly constant for different conduits with similar linings, but of course different values resulted for different materials. For semi-circular conduits, the values of n were fairly uniform, but were lower numerically than for the rectangular and miscellaneous forms. The numerical values given in the summary below resulted by taking the weighted averages of all of the values of n for the class of conduits in question. The development below indicates how the final values are obtained.

The remainder of the development is a question of mathematics only, and is as follows:

Let $V = ZR^x$

and $Z = K' V^{-n}$

so that, $V = K' V^{-n} R^x$

or, $V^{(1+n)=m} = K' R^x$

Let $K' = KS^{1/2}$

and reducing,

$$V = \left[KS^{1/2}R^x \right]^{1/m=b} = K^b\ S^{b/2=a}\ R^{bx=y}$$

Let $K^b = C$

so finally, $V = CS^a R^y$ .... (1)

The process is the same for rivers and large canals, except that n is positive instead of negative as above. The form of the final equation is the same in both cases.

The following is a summary of the numerical results:

Ordinary Conduits.—$a = 0.43$; $y = 0.869\ V^{-.25}$

	C
For unplaned plank	= 78
For lath in flume .12' c. to c.	= 64
For lath in flume 25' c. to c.	= 44
For pure cement	= 94
For small gravel	= 56
For large gravel	= 45
For brick (not very smooth)	= 75
For smooth masonry	= 77
For ordinary channels in earth	= 22—32

Semicircular Conduits.—$a = 0.46$; $y = 0.929\ V^{-.45}$

	C
For partly planed plank	= 97
For pure cement	= 114
For cement with one-third sand	= 104
For small gravel	= 74

Rivers and Large Canals.—$a = 0.76$; $y = 1.552\ V^{-.35}$; $C = 174$ to 248.

It is seen that C in the above summary varies through a wide range for rivers and large canals. The investigation on these large streams was not sufficiently extensive to warrant giving a more definite coefficient. The only measurements used for such streams were those made on the Linth Canal at Grynau, Solani embankment (Roorkee Experiments), Seine at Paris, and the Saone at Raconnay. These were the only measurements in the writer's possession that gave relations between V, R and S that were at all consistent. Other measurements were tried, but the resulting points were so much at random that nothing could be gained from them.

After the final exponential equations were determined, and the values for the coefficient obtained, the writer computed, by the formula submitted, the values for the velocities, using each of the readings given in 43 of the tables used. With one exception, the average computed velocity for each table differed from the average measured velocity by less than 6 per cent., while in the majority of cases, the difference was under 2 per cent. The results of the computations are recorded on the plates in the thesis to which reference has been made.

In applying the formula, the equation of the exponent for each class of conduits was plotted so that the value of y could be obtained readily for any given velocity. This made the application of the formula very simple as measured velocities were given. However, in some cases arising in practice, it would be necessary to first assume a value for V in order to obtain y, and this may require a second solution.

It may be noticed by many that equation (1) contradicts, in theory, the hypothesis originally used as a working basis, and which the data apparently verified, as the locus of the points obtained by plotting Log. V and Log. R was a straight line. But now the equation in its final form involves substituting for x the variable y. Theoretically, a curve with a variable slope could not be a straight line, so the question naturally arises, Would the locus of the latter equation differ sufficiently from a straight line, within the limits of the experiments used, to be discovered by the plottings? In order to answer this question the writer computed the values of y Log. R from the data in nine of the tables, and these were plotted with the corresponding ones for Log. V. The resulting locus differed so little from the straight line (none at all in a number of cases) that it was hardly noticeable. While within the limits of the experiments the contradiction is not serious, yet it emphasizes the folly of attempting to apply empirical formulas to conditions beyond those limits.

The bearing equation (1) has on the "sub-critical" velocity theory is no doubt evident to most readers. Some writers have said that the equation $V = C \sqrt{RS}$ expresses the law of flow until we approach quite low or "critical" velocities when the law changes. In the expression as usually proposed for the flow below the "critical" velocity, the exponent of R is said to be near unity. If the author's equations for y were plotted, it is seen that the exponent increases gradually as the velocity decreases, the increase being most rapid for low velocities. If the exponential equation here proposed can be accepted, it appears that we need no special theory for low or "sub-critical" velocities, so far as open conduits are concerned, and we have added evidence that nature's laws are constant and unchangeable.

Concrete Building Construction under Cover is being carried on at the present time on a new transformer house at Longue Pointe, Montreal. The building, which is entirely of reinforced concrete, measures 46 x 46 ft. in plan and is 32 ft. high. A tent with rounded ends 50 x 80 ft. over all and 25 ft. high at the eaves was erected over the site of the building and heated with salamanders and steam coils. The outside temperature up to the middle of December had reached as low as +3° Fahr. at night, and during some days did not go above 10°. Work was carried on continuously inside the tent. W. S. Barstow & Co., New York, are the engineers, and the Canadian White Co., Montreal, are the contractors.

Reinforced Concrete Chimneys.

Abstract of Report of Investigation made for the Association of American Portland Cement Manufacturers. By Sanford E. Thompson, M. Am. Soc. C. E., Consulting Engineer, Newton Highlands, Mass.

The first reinforced concrete chimney was built in 1898 by the Ransome & Smith Co. for the Pacific Coast Borax Co., Bayonne, N. J. Since that time about 400 stacks have been completed, and these are distributed through nearly every State of the Union and Canada. These stacks range in height above ground from 50 to 352½ ft. with inside diameters ranging from 4 to 18 ft., the majority of them being 150 to 200 ft. high and 5 to 6 ft. in inside diameter. Although the large majority of these chimneys have given satisfaction to their owners up to the present time, the failure of a few and serious cracks in several others have caused a number of inquiries to be made as to the reliability of reinforced concrete for chimney construction.

As a consequence of such questions, your Association has delegated the writer to investigate the causes of the faulty structures, and the condition of the chimneys now in service, with a view to reporting whether reinforced concrete may be safely recommended for chimney construction. With this in view the writer has visited and carefully examined a number of concrete chimneys; has investigated the causes for the defects in these structures; and has consulted with representatives of some of companies which make a specialty of this type of construction. Through inquiries made by your Association and by personal correspondence direct reports have been received upon nearly 150 chimneys. The results of this special investigation taken also in connection with two or three professional cases, in one of which opportunity was afforded for examination of the material in a chimney which was taken down, provide data for this report.

General Conclusions.—It is possible to present quite definite conclusions and recommendations with reference to this class of construction. The general conclusions which follow are considered in detail in the complete report, and reasons are given for their adoption.

(1) Reinforced concrete is a suitable material for chimney construction.

(2) Reinforced chimneys must be designed and built upon the same principles and by the same methods which have proved essential in other types of reinforced concrete construction.

(3) The defects and failures which have occurred in chimneys thus far built have been due to poor workmanship or faulty design or the use of the wrong concrete mixtures, or to all three.

(4) The methods of construction at present being followed are defective in many cases and liable to lead to subsequent failures, and they should be radically modified.

Investigation of Chimneys.—As already intimated, several reinforced concrete chimneys have fallen while being constructed, or at some later period, and the cracks developed in a number of others have raised serious questions as to their safety. On the other hand, in general chimneys built of reinforced concrete have given perfect satisfaction, this being attested by the fact that in many cases the owners have repeated their orders for such stacks, one corporation, for example, having built fourteen of them at its plants in various parts of the country.

The question, then, which confronts us is whether the faulty structures reported are due to qualities inherent in reinforced concrete; or whether they are due to defects in design and methods of construction which may be amended in the future; or whether they may be considered simply as accidental failures to which all engineering structures are occasionally liable. In other words, shall we condemn the building of chimneys of reinforced concrete, or may we dis-

regard the comparatively few actual failures as accidental, or shall we approve of building concrete chimneys, at the same time insisting that, to be sure of permanence, the methods of design and construction must be, in some cases, radically changed?

My investigations and examinations of chimneys have led me very decidedly to the third alternative. In other words, the writer is convinced that reinforced concrete chimneys can be built which are entirely safe and, practically indestructible, while recognizing that many have been erected with an utter disregard of the fundamental principles which have proved essential in all other classes of reinforced concrete construction.

In the first place, as we consider the problem, two principles must be recognized which may be termed axioms in engineering science. Failures do not necessarily throw doubt upon any class of construction unless the causes for failure are incapable of remedy. On the other hand, the fact that a structure or many structures have not failed is no proof that they are properly designed and built, since they may not have met with the most serious conditions or may be already stressed to a point so near breaking as to be liable to future deterioration from heat and frost and continued vibration.

To review the subject, therefore, the examination must be especially directed to the causes of the occasional failures and defects reported, with the object of determining, if possible, whether the conditions which have produced the troubles may be present in other chimneys and how they may be corrected in the future to prevent recurrence.

Eight cases have been reported in which chimneys have either blown over or have been taken down because they were defective, and ten or twelve others have been heard from in which cracks have developed which cause serious apprehension. In nearly every case of failure the chimney has been rebuilt by the construction company.

One of the failures most widely known is that which occurred at Peoria, Ill., in 1906. The chimney had been completed about three weeks when it gave way at the offset or projection, the upper part crumbling as it came down and the concrete breaking into small chunks. The T-shaped steel stripped clean from the concrete. The cause is stated to be a poor batch of concrete at the offset, although the manner of failure would indicate that the concrete in the upper portion also was not of the best quality.

Another case is cited in which the chimney stood for nearly two years, and then blew over in a wind storm of about 45 miles per hour. Here, as in the other case, the concrete stripped from the steel, and the fall was attributed to poor adhesion between the concrete and steel.

A stack built in very cold weather in Canada blew over when the concrete, which evidently froze without setting, thawed out.

A case occurred in 1905 where the upper 30 ft. broke and slid off while it was being topped off, the accident being charged to the fact that the mortar had not properly set.

This year a chimney in the West, after about two years' service, developed such cracks that it was considered dangerous, and was taken down and replaced.

Another stack was torn down, before the boilers were fired, because of defects in the workmanship.

The most recent failure occurred this last summer in Wisconsin where a chimney blew over, only two weeks after its completion, during a severe tornado which damaged many other structures. The blame is laid upon the unusual severity of the storm and the freshness of the concrete.

Considering the chimneys which are now in commission, we find that in general they are subject to more or less checking or cracking. This need not necessarily condemn the structure, since the reinforcement may be sufficient to hold together safely the blocks formed by the cracks, and yet it would seem that with the opportunity we have of introducing steel wherever needed all cracking ought to be averted, especially as there is always danger that the cracks may increase from wind vibration, heat and frost.

Our reports indicate in most cases that the cracks are not considered dangerous by the owners of the stacks. In several instances, however, long vertical cracks have appeared, and in others horizontal cracks have been found in the lower portion which have given serious concern. One chimney, straight when built, has since leaned about 3 to 4 in. from the vertical, beginning at a point about two-thirds up from the base. Another informant reports soft spots in his chimney.

About 400 reinforced concrete chimneys have been built in this country, and direct reports have been received by your Association and by the writer from nearly half of them. The failures cited amount to about 2 per cent. of the total number with at least 2 to 3 per cent. more of doubtful safety; it is probable that most of the seriously defective cases have been brought to light, since special care has been expended in running down doubtful ones. Of the others, even where personal examination has revealed somewhat serious cracks, the general verdict of the users is "satisfactory" and "good."

Reinforced concrete chimneys offer special structural difficulty because of the height to which they are carried, and the accompanying difficulty of obtaining the very best of workmanship. For this reason we might expect a somewhat higher percentage of error than in ordinary reinforced concrete construction. Even taking this into consideration, however, 4 per cent. appears to be a somewhat alarming proportion of defective construction. But the vital question is whether even these few cases may be passed over as isolated cases of defective construction, or whether they afford an arraignment of other chimneys now standing; and whether they predicate a similar percentage of defective construction in the future.

An examination by the writer of a chimney which was being taken down, if the structure is representative of others, throws considerable doubt upon their durability. On the other hand, it affords means for pointing out definitely the errors which must be guarded against in the future. This chimney showed soft spots in three of the sections, where the concrete could be readily loosened clear into the steel. The concrete was porous throughout, and scarcely bonded between the 6-in. layers. Samples cut from good portions of the concrete, which was a mortar of one part of cement to three parts of sand, gave an ultimate strength of about 1,200 lb. per square inch, or about one-half the strength of a good 1:3 mortar laid with a sufficient quantity of water. A month after this inspection the chimney was taken down, the 6-in. layers being readily loosened from each other and cut into pieces by a pneumatic chisel, and the concrete was found to vary materially in hardness. Of special importance was the fact that the mortar in the angles of the T-bars was weak and porous, showing scarcely any adhesion to the steel. Further investigation showed that the concrete, or mortar, used in the construction was of such extremely dry consistency that even where well rammed, the moisture did not cover all parts of the surface of a layer nor did it produce a proper bond with the steel.

From such evidence, it is impossible to avoid the conclusion that other chimneys built by similar methods, with so dry a mixture as to give a weak, porous concrete and to provide insufficient adhesion to the steel, are likely to cause trouble in the future.

This appears to be a severe arraignment of concrete chimney construction. And yet, to be fair, it must not be overlooked for a moment that every one of the points brought out, the low strength of the concrete, the dry mix, the porosity, the lack of adhesion to steel, the lack of bend, and the soft spots, indicate construction which would not be tolerated in any other case of reinforced concrete work. It has been proved beyond a doubt, and reiterated in print and verbally, that reinforced concrete must be mixed wet in order to have it adhere to the steel and protect the latter from corrosion; that a factor of safety of four is certainly a minimum in compression; and that a concrete structure must be essentially monolithic. It should be clearly understood, also, that in the chimney just referred to all of the essential elements were disregarded.

The defects noted are not inherent in chimney construction. In other words, from a practical standpoint, it is necessary to follow in chimney construction the methods which have proved necessary for success in other structures made from reinforced concrete. As a proof of this we may simply point to the indisputable fact that concrete chimneys have been built satisfactorily with a proper factor of safety and with a wet mix which insures a positive bond to the steel, and with a dense concrete which protects the steel from corrosion and permits bonding the various parts of the structure.

Since reinforced concrete is everywhere being constructed on these principles, and is proving durable and satisfactory, and is being used under all conceivable conditions, we have ample cause for security in reinforced concrete chimneys provided they are properly designed and constructed.

Effect of Heat.—In the above discussion the effect upon the chimney of the interior heat from the boilers is not directly referred to. Just what part this has played in the faults which we have noted is uncertain. Undoubtedly the interior heat adds to the stress in the concrete, and thereby increases the tendency to crack, especially at points near the top of the inner lining. This simply indicates, however, that the quantity and arrangement of the steel reinforcement should be adapted to resist this extra stress.

When reinforced concrete was first introduced it was questioned whether, with changes in temperature, the concrete and the steel would not expand and contract unequally, so as to make them separate from each other. If this were the case, it would be especially detrimental to a structure like a chimney where the range in temperature is greater than usual. It has been proved conclusively, however, that concrete and steel have substantially the same coefficient of expansion. For this reason there can be no separation due to change in temperature.

The interior heat affects the shell in another way, because concrete is a poor conductor. The interior surface for a depth of an inch or two becomes very much hotter than the exterior surface, and so tends to expand and crack the colder outside surface. This effect is most marked upon a thick wall, the action being similar to that of a thick glass bottle which breaks more readily when hot water is poured into it than does one of thin glass. The stress or pull on the outside surface must be met by increasing the amount of circular steel and placing it near this outside surface.

The effect of heat upon the concrete material itself is also a point which must be considered in chimney design. In the earliest chimneys built, the concrete lining extended the full height while in later ones it has ben generally carried up to only about one-third the height. Usually the lining has been reinforced concrete, although in some cases firebrick has been used. A few chimneys have been built with no lining at all.

While much remains to be learned with reference to the effect of heat upon concrete, it is known to be a most excellent fire-resisting material, although it has been found that a temperature as high as 1500° Fahr., continued for only two or three hours, will draw out the water of crystallization so as to take out the strength for a depth of ½ to 1 in. Lower temperatures affect the material less, and tests at the Watertown Arsenal indicate that a good cement mortar will not be appreciably injured at 600 to 700° Fahr. Tests of actual chimney temperature are extremely meager, but from records available we may say that the temperature in an ordinary chimney seldom exceeds 700° Fahr. at the base, while 400 to 500° is more usual. It is a fact not universally known among engineers that the temperature in in a chimney remains quite high even in its upper portion. For example, in the test of one chimney the temperature at three-quarters of the height above the base ranged only 10 to 20 per cent. lower than at the flue. This makes it evident that if the lining extends only one-third of the way from the bottom, the design of the concrete shell above it should be adapted to resist considerable heat, while greater safety may be insured by extending the lining far above the lower third.

Your Association has received no reports of injured linings. Many have never examined the interiors of their chimneys, but several have reported that the lining was in good condition. One correspondent states that after three months' use the interior surface of the chimney is "smooth, without cracks," and that "the soot does not adhere to the surface but falls to the bottom or is carried out by the draft." Since the fire-resisting quality of concrete increases very greatly with age, it is fair to assume that if the interior surface is sound at the end of the first two or three months it will not disintegrate after that time. In this connection, Mr. E. L. Ransome reports a recent examination of the inner shell of a chimney built nearly ten years ago of a true concrete of cement, sand and broken stone, in which he found the concrete in the hottest part of the chimney opposite the flue perfectly sound and exceptionally hard.

Concrete, then, may be considered as satisfactory for a lining or an inner shell in ordinary cases, although when exceptionally high temperatures are expected, say above 750° Fahr., it is on the side of safety to employ firebrick.

Summary.—In closing, a recapitulation of the most essential requirements for reinforced concrete chimney design and construction may be made:

(1) Design the foundations according to the best engineering practice.

(2) Compute the dimensions and reinforcement in the chimney with conservative units of stress, providing a factor of safety in the concrete of not less than 4 or 5.

(3) Provide enough vertical steel to take all of the pull without exceeding 14,000 lbs., or at most, 16,000 lbs., per square inch.

(4) Provide enough horizontal, or circular, steel to take the vertical shear (unless it does not exceed 50 lbs. per square inch in the concrete) and to resist the tendency to expansion due to the interior heat.

(5) Distribute the horizontal steel by numerous small rods in preference to larger rods spaced farther apart.

(6) Specially reinforce sections where the thickness of the wall of the chimney is changed or which are liable to marked changes of temperature.

(7) Select first-class materials and thoroughly test them before and during the progress of the work.

(8) Mix the concrete thoroughly and provide enough water to produce a quaking concrete.

(9) Bond the layers of concrete together.

(10) Accurately place the steel.

(11) Place the concrete around the steel carefully, ramming it so thoroughly that it will slush against the steel and adhere at every point.

(12) Keep the forms rigid.

The fulfilment of these requirements will increase the cost of the structure, but if the recommendations are followed, there should be no difficulty in erecting concrete chimneys which will give thorough satisfaction and last forever.

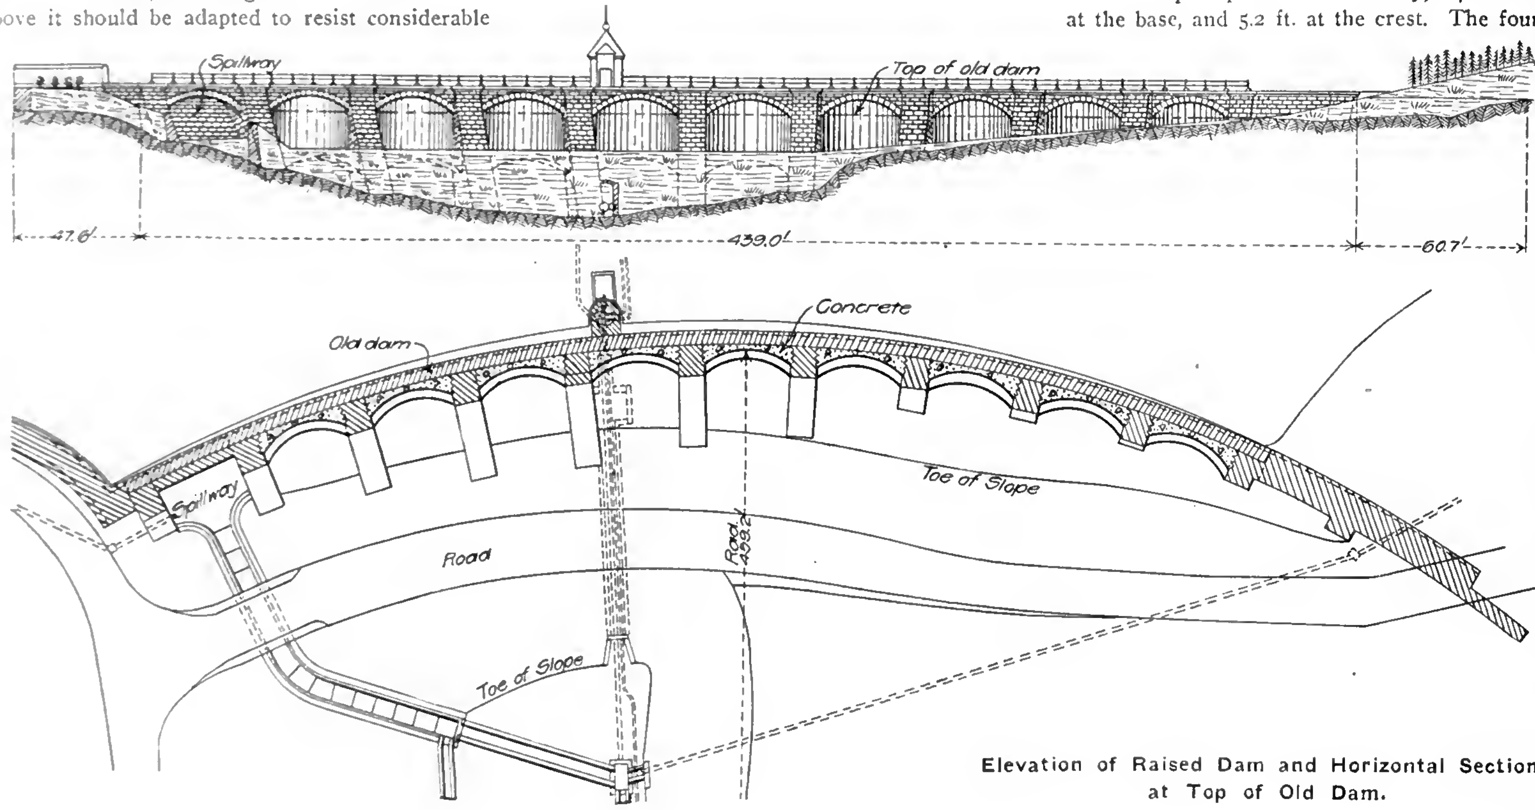
EXAMINATIONS OF MINE FOREMEN upon the State laws and its own rules relating to mining will be held every six months under a plan being worked out by the Delaware, Lackawanna & Western Co. The collieries will be divided into four districts of about five collieries each, and the averages obtained by all the foremen of each district will be taken together and a trophy awarded to the district standing highest. The trophy will become the permanent property of the district winning it three times in succession.

Raising a Dam at Lennep, Germany.

The city of Lennep, Germany, originally derived its water supply from gravel beds in the Valley of the Panzerbach, about two miles from the city. It became apparent in the early nineties that the supply was inadequate in times of long-continued dry weather and in 1893 a small dam was thrown across the valley at a narrow point in order to create a storage reservoir sufficiently large to tide over the dry seasons. From observations which had been made through a great many years, of rainfall and run-off near Lennep and at points in that part of Germany, where conditions were similar, it was determined that a yearly run-off of 1,259,700 cu. m. or about 333,000,000 gal. could be safely relied upon, the coefficient of run-off be taken as 68 per cent. of the rainfall. The yearly consumption in Lennep in 1892 was 52,800,000 gal. It was decided to create a reservoir with a capacity of 31,700,000 gal.

The dam was about 417 ft. long, 37.7 ft. high at the deepest point of the valley, 24.6 ft. wide at the base, and 5.2 ft. at the crest. The foundation consisted of hard blue slate with a covering of soil from 7 to 10 ft. deep. The structure was curved upstream, being in plan the segment of a circle with a radius of 459.2 ft., both ends abutting against the solid rock walls on both sides of the valley. A spillway 32.8 ft. long, with its crest 1.6 ft. below the top of the dam, was built in the structure on the right hand side of the valley. At the highest section of the dam a tunnel 4.2 ft. wide and 5.9 ft. high was built in the masonry; and through it were laid the service conduit and the waste pipe for emptying the reservoir, the opening being walled up when the installation of the pipes was completed. In order to make the dam thoroughly waterproof, two thicknesses of dense cement mortar were applied on the water side of the structure, one of the thicknesses being protected by a 23.6-in. wall, and the other, applied on the outside, by a waterproofing compound. The soil was stripped over the entire area of the reservoir.

In 1901, an exceptionally dry year, the capacity of the reservoir proved inadequate and the water level dropped so low that cool, clear water could not be obtained. An investigation was therefore undertaken to determine whether the existing dam could be raised so as to increase the capacity of the reservoir to 71,800,000 gal. The



Elevation of Raised Dam and Horizontal Section at Top of Old Dam.

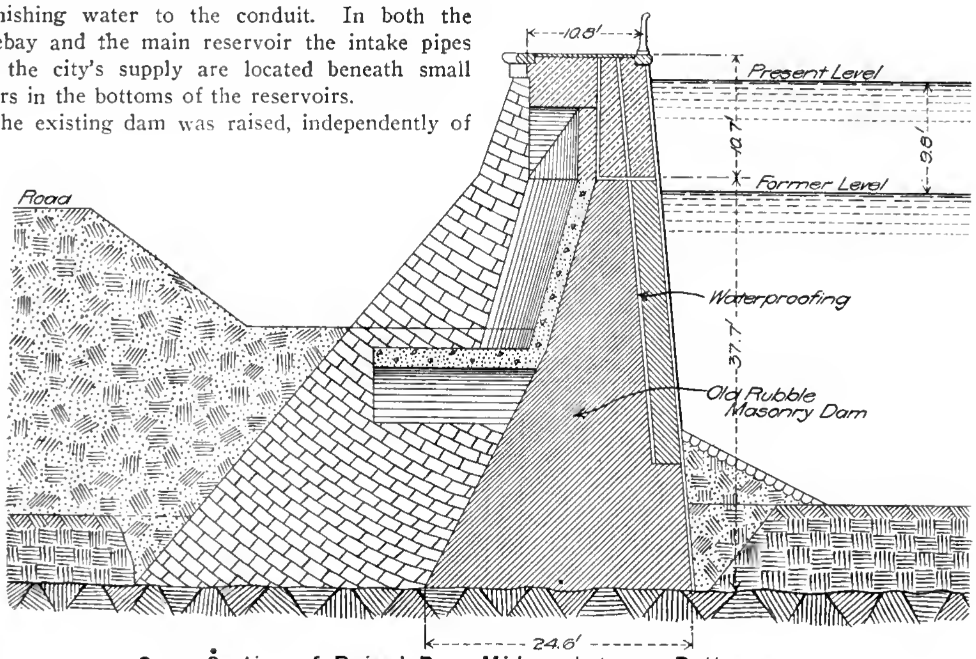
designer of the original wall, Herr Albert Schmidt, was commissioned to draw up plans for the work; and from his account of it in the "Zeitschrift fuer Bauwesen," these notes have been taken. Before the work was started the plans were submitted to the Ministry of Public Works for approval.

Simultaneously with the raising of the crest of the dam, plans were carried out for improving the quality of the water. Some distance upstream headworks were installed for distributing the water over a grass grown field, so that the vegetation would hold back all floating matter. From this field it flows to a meadow underlaid with drain tile, is filtered and flows to a forebay with a capity of 8,450,000 gal., separated from the main reservoir by a small curved dam, in the crest of which a weir has been placed so as to discharge into the larger body of water. The forebay was built separately from the main reservoir in order that the latter might be emptied, inspected and repaired in the fall of the year when the stream-flow is more than sufficient to supply the demand, the forebay during such time furnishing water to the conduit. In both the forebay and the main reservoir the intake pipes for the city's supply are located beneath small filters in the bottoms of the reservoirs.

The existing dam was raised, independently of the new construction, a height of 10.7 ft., the water level in the reservoir being raised thereby about 9.8 ft. The added masonry was carried to solid bearings in the rock on both sides of the valley. In front of the old wall on the downstream side, twelve buttresses 41 ft. on centers and 9.8 ft. thick were constructed, extending out beyond the original structure about 26 ft. at the base, in the deepest point in the valley, 10.7 ft. at the crest of old dam and 7.4 ft. at the top of the new crest. Between the buttresses at a level of half the height of the maximum depth of the wall, horizontal arches of concrete were sprung. They extend back of the old wall, a minimum distance of 11.8 ft., have a rise of 4.9 ft. and a thickness of 2 ft. at the crown. Below these arches the old dam is left exposed, the reinforcing, except for the buttresses, being kept above the springing lines of these arches. The latter are continued until their plane intersects the rock sides of the valley, where solid masses of concrete carry any thrust from them to the solid rock, thus giving, according to Herr Schmidt, an exceptionally strong and stiff construction by reason of the continuous arch action.

At the top of the buttresses a second series of horizontal arches is sprung. These arches, of hammer-dressed gray trap, have a span of 31.2 ft., and a rise of about 6.6 ft., are 6.6 ft. wide, and 3.28 ft. thick at the crown. As is the case with the lower series of arches the upper ones are carried continuously until the plane intersects both sides of the valley, where they are brought to a firm bearing on the solid rock. Despite the fact that ample provision has been made to take advantage of the arch form of the dam by using these horizontal arches, this action was not considered in the design, the gravity section of the masonry alone being sufficient for stability.

In order to carry over to the buttresses the increased water pressure which the old dam cannot carry, vertical arches have been sprung between the buttresses against the back face of the old dam, and between the level of the two series of horizontal arches just described The vertical arches are of concrete, 1.64 ft. thick midway between the buttresses, the arch surface intersecting the buttresses 6.56 ft. back from the downstream face of the old dam. The entire new construction, therefore, consists of a series of buttresses and arches built in front of the old wall and its newly-added top, and bearing against the solid rock on both sides of the valley. All parts of the work are founded on solid rock,



Cross Section of Raised Dam Midway between Buttresses.

which was carefully cleaned of all loose pieces and scrubbed with water under high pressure. The holes and crevices were then filled with cement mortar before construction was begun. The rock foundation was cut in saw-toothed shape so as to secure a better bond between it and the superstructure.

The same mortar mixture was used for the concrete and for laying the stone work, the proportions, Herr Schmidt states, being found by experience to give the best and densest, and at the same time the cheapest mortar. The mixture consisted of 1 part Portland cement, 1 part slacked lime paste, 1½ parts fine crushed trass and 4¾ parts of washed sharp sand. For the concrete 45 per cent. of this mortar was used with the broken stone. The face stones are of hammer-dressed gray trap and the body of slate.

On the right hand side of the valley a waste weir of the same width as the original one has been built. The water flows down over a stepped channel 6½ ft. wide and joins the original stream bed some distance below the dam. Assuming a coefficient of discharge of 0.5, the capacity of the weir is about nine times that of the run-off of the maximum flood of November 24, 1890, which for a precipitation of 1 cu. m. per second per square kilometer gave a run-off at this point of 1½ cu. m. or about 53 cu. ft. per second. A gate-house for operating the valves, both of the conduits and the drain pipes is built at the center of the dam. The drains are proportioned so as to discharge more water than can be supplied by the highest recorded flood.

In order to measure the movement of the dam under different heads and temperature variations, permanent points have been established on both sides of the valley and two points on the dam on a straight line between those on shore. The points on the dam can be shifted by means of micrometer screws in order to measure the movement. This amounted to 3 mm. when the reservoir was first filled after the dam was raised, and a further movement of 4 mm., due to temperature variations, has been noted.

In designing the dam the weight of the masonry was taken as 143½ lb. per cubic foot and of the concrete 118.6 lb. per cubic foot. The pressure line when the reservoir is at its highest level falls within the middle third of the body of the wall and consequently there is no tension in the masonry, the same being true of the buttresses. It is therefore apparent that the stability of the dam is assured independent of possible arch action. The maximum pressure in the old dam is 3.07 kg. per square centimeter or about 3.14 tons per square foot, and in the buttresses 3.86 kg. per square centimeter or about 4 tons per square foot, the minimum pressures being about 0.15 and 2.1 tons per square foot respectively.

The construction used for raising this dam, according to Herr Schmidt, can just as well be used for the construction of a new dam, in which case instead of building a continuous wall in front of the buttresses vertical arches would be sprung between the latter. Such a construction, the paper states, would effect a saving in first cost of 16 per cent.

A SMALL POWER PLANT at Pittsfield, Mass., has recently been built which is interesting on account of its use of oil engines. It belongs to the Pittsfield Electric Co., which has a steam-driven station in the heart of the city. The new station is a 60x73½-ft. building constructed of concrete blocks made at the site with Pettyjohn machines. These blocks were cheaper than brick. A railroad siding extends along one wall and fuel oil is delivered in cars on it, being stored in three 6,000-gal. tanks outside the building. From these tanks the oil is delivered by gravity into the basement, from which an attendant pumps the oil once an hour with a hand-operated registering pump into a couple of tanks in the engine room. The station contains at present a 350-kw. Stanley alternator mounted on a shaft between two 16x24-in three-cylinder Diesel engines. The latter operate on a four-stroke cycle, but differ from other internal combustion engines in compressing a full charge of air to a point above the igniting point of the fuel, and then injecting this fuel for a certain period, variable according to the load, into the hot air, where it burns under controlled limits of temperature and pressure. The operation is, therefore, one of combustion rather than explosion. Each engine is rated at 225 h.p. The station has two air compressors, each capable of supplying air to two engines under pressures of about 1,000 per square inch, and special steel piping is installed for the air. With each engine there are six air bottles, of which two are connected normally with the air pipes to absorb fluctuations in the air pressure and the other four are kept charged so as to furnish a means of starting the plant from rest. Cooling water is drawn through a conduit from a neighboring lake to a well, whence it is pumped by a motor-driven triplex pump to the jackets of the air compressors and the engine cylinders. Four 10-in. discharge pipes carry the engine exhaust from the station, but only two of these are needed for the present service. They are kept filled with 8 ins. of water and discharge into the neighboring lake.

Sewage Disposal Works at Lake Placid, N. Y.

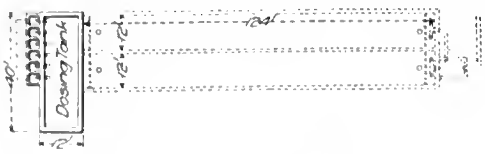
Lake Placid, N. Y., is one of the largest and most popular summer resorts in the Adirondack Mountains. It is about 2,000 ft. above sea level and its population, together with that of the hotels and cottages immediately about the village, varies between extreme limits of about 2,000 in winter and 7,000 in summer. In general, however, the average summer population is approximately double the winter population, and neither of the extreme limits continues for more than a short season.

To collect and treat the sewage of Lake Placid and the Whiteface Inn district, two systems of sewers and a sewage disposal plant have recently been constructed. The sewerage system in the village of Lake Placid comprises about five miles of sewers varying from 6 to 15 in., and the system in the Whiteface Inn sewer district comprises about four miles, varying in size from 8 to 12 in. The combined flow from these two systems is treated in a disposal plant consisting of a double-chamber septic tank and six intermittent sand filters. The present disposal plant is designed so that its capacity can be increased by the addition of another septic tank chamber and more filters and siphons without interrupting the operation of the present plant or changing the size of the present grit and dosing chambers.

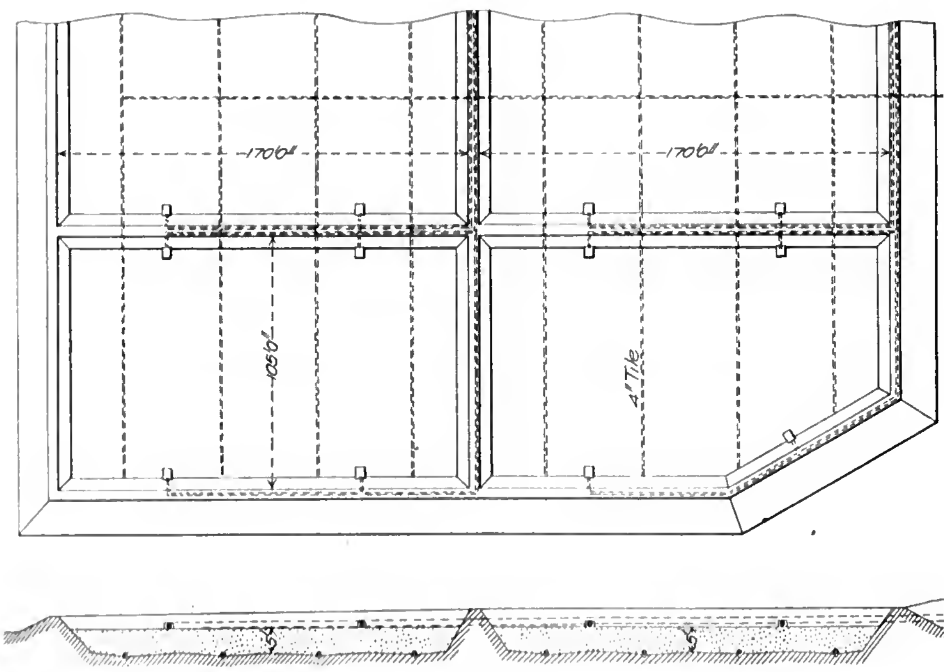
The disposal plant is designed to be operated at half its maximum capacity during the winter and the two compartments of the septic tank are accordingly equal in size. Each compartment is 12 ft. wide, 124 ft. long and 5 ft. deep. The tank is built of concrete and is covered with earth, two manholes over each compartment being provided for ventilation. The flow from the main trunk sewer first enters a 9x6-ft. grit chamber 5 ft. deep, at one end of the septic tank. Between the grit chamber and each compartment of the septic tank is a controlling valve by which either compartment may be cut out. Just inside each chamber on the inlet pipe is a tee and on each end of each tee is a 90 deg. elbow and a short piece of pipe. The arms of the tees are of the right length to bring the discharge pipes to the outside quarter points in the width of each compartment. In front of each discharge pipe is a baffle board, placed so as to distribute the flow as evenly as possible throughout the cross section of the tank.

Two feet from the wall at the outlet end of each compartment is a baffle, which extends down into the sewage half its depth, and in the end wall of each compartment are three weirs, the crests of which can be adjusted to any width up to a maximum of 24 in. The sewage passing under the suspended baffle and over these weirs, flows into a 12x[illegible]-ft. dosing tank 5 ft. deep in which are six 10-in. Miller automatic siphons supplied by the Pacific Flush Tank Co., Chicago. These are set to discharge in rotation and are arranged so that any number can be cut out, at the same time leaving those still in use operating in uniform rotation. Contiguous to the dosing tank are six [illegible] chambers into each of which one of the [illegible] siphons discharges. From [illegible] the effluent of the septic tank [illegible] beds, any one of which [illegible] cutting out the [illegible] particular bed. The dose delivered to each bed at each discharge is 17,000 gal., but this may be varied by setting the siphons to discharge at different depths. There [illegible] a bypass from the dosing tank by which the septic tanks may be operated without the filters. There is also a bypass through which raw sewage may be delivered directly to the filters without entering the septic tanks. There is no bypass, however, by which raw sewage may be discharged into the stream which receives the effluent of the plant. The floor of each septic tank chamber slopes toward a depressed clean-out pipe and one chamber can be cleaned of sludge while the other is in operation.

Each of the six intermittent fiters has an area of 0.4 of an acre and a depth of sand of 5 ft. It was originally planned to use a sand with an effective size of about 0.25 mm. excavated from a side hill nearby. Eventually, however, it was found impossible to secure enough sand of this size without any excessively long haul, and accordingly a finer but carefully selected sand was used. The sewage discharged by each siphon flows through a separate pipe to the nearest corner of one of the filter beds. Here the flow is taken by two pipes laid in the embankments of the beds and is delivered equally at four points on the perimeter of each bed from which points it is further distributed by wooden carriers. Each bed is underdrained by four lines of 4-in. tile aranged as shown on the accompanying plan.



Plan of Septic Tank.



Part Plan and Section of Sewage Filter Beds at Lake Placid.

Each drain is covered with about 6 in. of gravel or crushed stone and about 2 in. of coarse sand. The collecting drains lead to a central intercepting drain which discharges into Chubb River.

Chubb River has a drainage area above the disposal works of about 30 square miles. About three miles below Lake Placid it flows into the west branch of the Ausable River, the water of which, about eight miles further downstream, is used for drinking purposes by the village of Wilmington. At this point the river has a drainage area of about 150 square miles. Before the sewage disposal plant was installed traces of pollution due to the discharge from the Lake Placid sewers were found in the water at Wilmington, although at that time less than half as much sewage was being discharged into Chubb River at Lake Placid as is now being treated at the disposal plant. Since the plant has been in operation there has been no complaint concerning the condition of the water at Wilmington.

The sewerage works of Lake Placid were designed by Mr. Charles E. Collins, consulting engineer, Philadelphia, Pa. The disposal plant was built by Messrs. McCaghey & Linehan, of Little Falls, N. Y., the total cost of the plant being $26,000.

The Finish of Concrete Surfaces.

There are a good many methods of finishing concrete surfaces now in use, and it is probably true that most engineers have their favorite methods and are inclined to disregard the merits of all others. It is at times rather important, however, to be able to impart a variety of surface textures to concrete in the same structure, and on this account attention is called to the following comprehensive paper on the subject, read before the Boston Society of Civil Engineers on Dec. 11, by Mr. M. C. Tuttle, secretary of the Aberthaw Construction Co., of Boston, one of the pioneer companies making a specialty of concrete work.

Granolithic Finish.—The most common type of finish is the troweled or granolithic surface. The objections to it are its flat dull color, the prominence of any crazing or cracking which may occur, its slipperiness under foot and the prominence given any inequality, in its surface when the light strikes it diagonally. A slight hollow or ridge will show as a shadow and is accentuated greatly. From the construction standpoint there is little objection to this surface, provided the finish is put on before the body of the concrete has set and the surface is properly troweled.

The hard-troweled surface probably protects the under body of concrete from outside moisture as perfectly as any dressing that can be given. In proof that the granolithic surface is waterproof, Mr. Tuttle's firm, as a side line to its general construction, builds a great deal of sidewalk vault light work. The sidewalk is constructed of glass discs 1⅝ in. in depth with steel rods between them, all embedded in cement mortar which is troweled hard. These sidewalks properly built are absolutely watertight and give no trouble from moisture working through, even in the form of dampness.

One objection to granolithic finish for protection for concrete masonry is its great brittleness. Any crack which develops in the masonry below will certainly come through to the surface and allow water to get into the body of the concrete. The only method of finish which would permit cracking of the surface would be some elastic substance like asphalt and paper.

Rough Picked Work.—For wall work it is common to pick the surface with a pointed or toothed tool. This chips off the mortar which may have flushed to the surface and cuts away little parti-

cles of the mortar from the aggregate below. The roughening of the surface breaks up the light, gives a lighter, snappier color to the mortar itself, and besides this exposes the color of the aggregate below. Oftentimes where gravel is used the stones show rusting and have various shades of browns and reds. This additional color on the concrete adds a great deal to its appearance and when the dressing is carefully done it gives, in Mr. Tuttle's opinion, as pleasing a surface as can be obtained economically. The dressing removes most of the traces of the form and does away with inequalities which may occur in the work.

The objection to this kind of dressing comes in the removal of the surface mortar, which is the most waterproof part of the concrete. If there is any tendency towards porosity in the mass of concrete, it will absorb more moisture after the dressing than before it and will accentuate the injury from frost. From Mr. Tuttle's observation on well-handled and properly proportioned concrete, he is convinced there is, however, little danger from this, as the material is of itself very dense and waterproof. His firm built the fence around Soldiers Field in Cambridge in 1896. This is in low land along the river, where it is fairly damp. It is exposed fully to the weather and is in thin sections. He has watched this carefully and is unable to discover any surface deterioration from the weathering.

This rough picking shows the masonry honestly as concrete, without any imitation of other material. It gives a pleasing surface and one that can well be used on building work. A fairly good Boston example of this dressing is the little subway station on State St., near Atlantic Ave., built by Mr. Tuttle's firm under the direction of the Transit Commission. A comparison of the appearance of this dressing and of stone surface is readily afforded by the other subway stations. A laborer with a hand pick will dress between 40 to 50 ft. of concrete surface two to three weeks old in one day. With a pneumatic tool laborers will get over 50 to 60 ft. There is but the slightest difference between the work of the hand tool and the machine tool. The depth of the cutting and the fineness of it can, of course, be varied to suit the conditions. This is the surface that the architects use generally for their landscape and other ornamental work. Messrs. Fox & Gale use it in the garden work for Mr. Larz Anderson, of Brookline, and Messrs. Little & Browne used it on the Sicilian garden which the Aberthaw Construction Co. built for one of their clients at Beverly Cove. From the point of economy as well as good looks, this dressing for wall surfaces deserves attention.

Rub Mortar Surface.—Mr. Tuttle's firm built the past year two small factories for the Goodell Pratt Co., at Greenfield, under J. R. Worcester & Co.'s specifications. The method of finishing the walls struck him as thoroughly good for this class of building and the appearance was satisfactory. They specified as follows:

"After the forms are removed, the concrete shall be thoroughly wet with a brush and then rubbed with a coarse carborundum stone No. 16, bringing the surface to a lather. After this stone has been used sufficiently to take off the rough projections, the lather shall be washed off with a brush and the concrete again wet, and then dusted with a mixture of dry sand and cement, the proportion being one part of cement to two parts of sand. This shall be rubbed into the surface with the coarse No. 16 stone. Care shall be taken not to allow any of the mortar to remain on the surface. To give the final finish, a No. 30 carborundum stone shall be used and the whole surface well rubbed."

This finish gives a lighter surface than troweling, fills any pores that may be in the cement coating, and leaves the masonry more waterproof than it was originally. It seems to Mr. Tuttle an excellent method of finish for factory buildings, bridge abutments and concrete engineering works. This can be done fully as economically as picking.

Air Blast.—When the Aberthaw Construction Co. built the Stadium at Harvard, they tried, under Professor Johnson's direction, the dressing of the surface with air blast. The men employed had no experience in this work, but the experiment proved that the surface could be dressed this way and bring out the color of the stone underneath. Mr. Tuttle has no data as to the cost of this, but believes it to be a little more expensive than picking.

Hammered Surface.—With a stone hammer concrete made with a fine aggregate can be dressed to a good surface. The Transit Commission have used this in some of their exists and are using it now on parts of the Washington St. tunnel. With an eight-blade hammer it is necessary to have fine aggregate near the surface, as the hammer will not dress down through the end of a large stone which appears on the surface. A laborer with an eight-cut hammer working on the exit near the Old South Church stated that he could go over about 25 sq. ft. of surface per day. For fine detail work and for finished concrete block, and necessarily for imitations of natural stones, this form of dressing is used and is quite successful and satisfactory. It is more expensive than picking.

Acid Treatment.—It has been found that by applying dilute sulphuric acid to concrete surfaces and rubbing this with a steel brush, the cement can be dissolved away from the particles of aggregate and the color brought out very prettily. A United States patent was taken out to cover this process. Mr. Tuttle could not state how far this patent covers the matter.

Plastered Surface.—It has seemed to Mr. Tuttle that in the future concrete construction will be built more to standards as to size of columns, depth and thickness of beams, and that this will necessitate the use of plastering and modeling in order to bring a building to its desired form. It would seem that the present methods of building forms so accurately that the concrete shall assume its final shape in them is too expensive, and that eventually this work may be done more roughly and the surface brought up with an application of plaster or some other means of finishing. The cost of handling the concrete forms to exact masonry lines is very great. It is not exceptional to have the centering of the two sides of a plain wall cost 15 cents a square foot of wall surface or 7½ cents for each side. This cost can be much reduced if the work is not done so accurately.

A cheap method of finishing wall surfaces is to mix small pebbles with mortar and throw these at the wall. If the surface is kept free from freezing or from too quick drying out, they will adhere and make a rough, pleasing surface. This has been used by at least one architect for the finish of some cow barns. The ordinary methods of plastering slap dash and finish work are too well known to need any description or criticism. The difficulty of making a perfect bond between the original masonry and the plastering is the main difficulty from the structural point of view. From the artistic point of view, the plasterers make much of the dressed surfaces that appear in concrete work and they produce very pleasing if not permanent results.

Instruction in Steam Turbine Operation is a novelty recently added to the high school curriculum of the Board of Education of New York City, a 300-kw. Westinghouse-Parsons turbo-generator unit having been installed as a part of the power plant equipment of the new Stuyvesant High School, just completed, and is available for instruction and testing purposes.

The Design of Wayside Stations for Single-Line Railways.

A paper by Frederick George Royal-Dawson, published by the Institution of Civil Engineers.

In the early days of railway construction in India the location and design of station-yards were based more or less on English ideas, which were themselves then in a comparatively undeveloped state. As traffic increased the stations were extended from time to time in a haphazard manner, in the attempt to keep pace with the growth of traffic. But this process could not go on indefinitely, and when the point was reached at which a yard could no longer be adapted to the increased traffic, it had to be entirely remodeled at considerable expense, with complete dislocation of traffic for the time being.

In many engine-changing stations, where the engine-shed had originally been built too close to the main platform, thus preventing the proper expansion of the yard, the press of traffic has at length compelled the removal of the entire locomotive yard to a more remote site. In other stations, again, where insufficient space had originally been left between the goods-shed and the main line, expansions of the goods-yard have had in consequence to be made on the opposite side of the main line, till the constant shunting of all goods-trains across the main line, which this arrangement necessitated, has become such an intolerable nuisance that an entire remodeling has been inevitable. Such remodelings are going on at the present time in all parts of India and absorb funds which might otherwise have been available for other purposes.

The growth of local traffic, however, is not the only factor which has necessitated the remodeling of station-yards. Another factor which has reacted on the design of many minor wayside stations is the modern demand for through trains at high speeds. This demand on the part of the public has synchronized with a growing recognition, on the part of railway managers, of the economic importance of getting the maximum use out of their rolling stock. The public and the managers are thus agreed as to the desirability of a certain percentage of fast trains and the expeditious transportation of goods; and, as safety is of the first importance under these new conditions, the principles of safe working have become a special science, the main fruits of which have been interlocking and automatic block-working. These two mechanical factors of safe working are being introduced gradually throughout the principal lines of India; and, although their use is not compulsory, their omission entails the imposition, in the one case, of speed-limits over facing-points, and in the other case, of irksome rules in connection with "line clear" messages.

Another factor which threatened to influence the design of station-yards a few years ago was the effect of quick-acting brakes on trains entering turnouts. It was considered that with the use of such brakes there was a tendency to enter turnouts at dangerously high speeds, and that the use of split turnouts, by easing the curvature, would mitigate the evil. But other considerations, to which reference will be made later, prevailed, so that the split turnout has never found favor, except perhaps on a few unimportant lines where fast non-stopping trains are not scheduled.

Types of Stations. Omitting large termini and junction-stations, which obviously require special treatment, different localities present such a variety of traffic conditions that wayside station-yards must necessarily be of many different types. Thus, comparing a busy double-line suburban railway, on which the stations are not more than about a mile apart, with a busy double-line section of a trunk-line up-country, having stations, say, six or seven miles apart, it will be seen that,

whereas a wayside station on the former consists of little more than an up line and a down line, each with its own substantial platform, and perhaps a trailing cross-over road, the trunk-line station requires in addition an up and a down lie-bye siding, and a more or less developed goods-yard on one side, to which access is obtained trailing from both the near and the off track, involving in the latter case a diamond-crossing over the near line.

Again, in single-line working the traffic conditions may be such that (*a*) all trains stop as a matter of course at every station, as in small branch lines, or (*b*) there is a large percentage of fast trains which do not stop at every station, as on important trunk-lines having a fluctuating local traffic. In the former case there may or may not be an up and a down platform, and the station may be approached either by means of a split turnout or otherwise. The number of signals may also be reduced to a minimum, and interlocking is not necessary. But in case (*b*) the station must be designed primarily for the safety of fast through trains, and secondarily for the development of local traffic; and as this class of station plays the most important role in the transportation problem throughout India, the question of a suitable design has been the subject of much discussion from time to time, and is even now far from being settled. In this paper, therefore, the author proposes to confine himself to a consideration of this problem alone, and will begin by reviewing some of the discussions on the subject which have taken place in India during the last few years, and the conclusions arrived at.

Double-line Principle Applied to Single-line Stations. In 1895 Mr. W. H. Cole, then deputy manager of the Eastern Bengal State Ry., having been on special duty in England for the purpose of studying the question, embodied his conclusions in a note on the design of yards for single lines in India. Briefly, the type which he advocated was that shown in Fig. 1, which involves an up and a down line, with corresponding platforms, trains from both sides entering the facing-points on the straight and running through the trailing-points on the turnout. This design was circulated, with others, by Mr. J. R. Bell, then consulting engineer for state railways, in 1896, among various railway officers, for the purpose of obtaining their opinions. On the assumption that the up and down line principle was desirable, the relative merits of this type, as compared with the symmetrical or split-turnout type (Fig. 2), were discussed. The general verdict was that for ordinary trains there was little to choose between the two types, except that the symmetrical type tended to minimize the length of the station. But for fast through trains it was held that the split turnout was a source of danger, and that the Cole type was preferable in that respect. Thus the split turnout became eliminated for the time being from the discussion, as unsuitable for lines having fast through traffic.

It was revived by Mr. F. J. E. Spring, when officiating director of railway construction, in 1902, on the ground that, with the introduction of quick-acting brakes, trains were liable to enter ordinary turnouts at excessive speeds, the effects of which would be mitigated by the use of split turnouts having easier curves. But in the discussion which followed, the verdict of 1896 was confirmed, inasmuch as the split turnout, although favorable to stopping trains, was a source of danger to fast through trains; for, however easy the curve might be, the real point of danger was at the switch, when that was set to divert a fast train from the straight. The danger, it was pointed out, lay in the tendency of the leading outer wheel of an express engine to mount the switch, especially if the wheel-flange were somewhat worn; and, as the safety of fast through trains was of paramount importance, it was held to be essential that at stations subject to fast through traffic the facing points at least must be on the straight.

It still remained to be considered whether the Cole type (Fig. 1) satisfied all requirements, or whether any other type would be preferable. This raised the preliminary inquiry as to whether it was necessary or desirable to preserve the double-line principle. No very clear reason could be given for compelling all trains, whether fast or slow, to take the left-hand road in entering a station beyond the vague plea that it was "English practice." It was thought to simplify matters for the driver, to diminish the risk of collision, and to simplify the signaling, as a train could be admitted by a one-armed home-signal at the facing-points, interlocked so as to be capable of being lowered only when the points were set for the straight. The single-line principle, however, by which all lines would be equally available for up and down traffic, presented no difficulties; for two-armed routing-signals at the points, the higher for the straight and the lower for the turnout, would give the driver all the information he wanted, while the List and Morse system of interlocking, as used on the North Western State Ry., illustrated how, at small cost, it could be made impossible for two trains from opposite directions to be admitted simultaneously on to the same line. Thus it was clearly established that the double-line principle was not necessary for safe working. It only remained to be seen whether it was desirable.

The system, it was pointed out, necessitated two platforms, so that passengers entering or leaving trains on the opposite side to the station-building would have to cross the line, which they would usually do on the level, even if an overbridge were provided. And even although the platform on the off-side might be merely a surface dressing at rail-level, so that the first cost need not be an obstacle, the difficulty of dealing effectively with an up and a down train at the same time without duplicating the staff was another permanent objection. It might be argued that these drawbacks exist at every station on a double line, but on a double line two platforms are a necessity, whereas on a single line, the necessity for two platforms disappears, and the question is reduced to one of expediency. Regarded in this light it is at once apparent that (*a*), with a given staff, trains can be far more economically and effectively dealt with from one platform than from two; and (*b*) with a single platform passengers are not exposed to the danger and inconvenience of having to cross the line.

There remains another side of the question to be considered, namely, the facilities for passing trains of different descriptions. The contingency of a slow train being side-tracked for a fast one in one direction, while another train was admitted from the other direction, necessitated the provision of a lie-bye siding available for trains from either direction, in addition to the two lines for crossing purposes. With the double-line principle of working, a lie-bye siding would have to take off (preferably in a trailing direction) from each through line; that is, two lie-byes would have to be provided, although not more than one would ever be used at one time. On the other hand, it was seen to be possible, by abandoning the double-line principle of working, and by making either line available for trains in both directions, to do with one lie-bye siding only, which would be "trailing" for one direction and "facing" for the other.

Single-line Principle. Thus, the advantages of what may be called the "single-line principle," as opposed to the "double-line principle" in working ordinary wayside stations on a single line, were established, and may be summed up as follows: (*a*) the double-line principle requires two platforms, the single-line principle only one platform; (*b*) the double platform involves a larger and more responsible staff than the single platform; (*c*) the double platform is more dangerous and more inconvenient to passengers than the single platform, and accidents can be prevented only by the erection of an overbridge and by the provision of extra supervision to enforce its use; the cost of the overbridge and the extra supervision are saved in single-platform working; and (*d*) the double-line system involves the construction of at least two lie-bye sidings, while the single line requires only one.

The issue is thus narrowed down to a question of the suitability, or otherwise, of the Cole type (Fig. 1) for single-platform working. From this standpoint it is at once evident that trains would be more favored in one direction than in the other. For, supposing the platform to be placed as shown at *A* in Fig. 1, trains from the right would always have a straight run to the platform, while trains from the left would either have to take the first turnout facing, or shoot past on the straight and, after passing the second turnout trailing, shunt back to the platform. The latter procedure would be appropriate enough in the case of crossing trains, but in the majority of cases when the train from the left had a clear platform it would approach by the turnout as a matter of course.

The defects of the design, however, are most apparent when a slow passenger train from the left and a non-stopping express from the right are approaching the station at the same time. The station master is confronted with the following dilemma: (*A*) if the slow train is admitted directly to the platform line, the fast train would have to be put on to the other line by a facing turnout; (*B*) if, on the other hand, the slow train is put on to the off-line, there would be difficulty in preventing passengers from attempting to cross the intervening track in the face of the fast train. Thus, in the handling of the two trains two alternatives are open, both of which are dangerous. But the danger arises from different sources in the two cases. In case (*A*) the danger lies in the alignment of the off-line, and would disappear if that were made straight, while in case (*B*) the danger lies, not in the alignment, but solely in the relative position of the two trains, and is inherent in any system which allows a fast train to pass between a halted passenger train and a platform. These considerations simplify the issues, for case (*A*) clearly indicates that the run-through line should be straight from end to end, the other line thus becoming a loop, and case (*B*) equally clearly indicates that the run-through line should not be between the loop and the platform.

Platform on Straight vs. Platform on Loop. The principle of the straight run-through, deduced from case (*A*), has now been generally accepted by railway authorities, in supersession of the Cole type. But the principle of the platform on loop, deduced from case (*B*), has not by any means found general acceptance. In fact, when in 1896 and again in 1902 the various Indian railway officers were asked to choose between the two types shown in Figs. 3 and 4, which may be described as "platform on straight" and "platform on loop," respectively, and both of which satisfy the condition of a straight run-through, a surprisingly large number voted in favor of the former, Fig. 3. The reason given for this preference was to avoid the lurch at the turnout to which all stopping trains were subject when the platform was placed on the loop, as in Fig. 4. The danger of allowing a fast train to pass between the platform and a side-tracked passenger train which the former type involved was lightly considered, and in some cases ignored altogether, by the adherents of this type. It was held that the undoubted comfort of the many should out-

weigh the problematical danger of the few. On the North Western State Ry., however, where the ratio of non-stopping to stopping trains, including goods-trains, was comparatively large, namely about one to seven, the verdict was strongly in favor of the platform on the loop, Fig. 4.

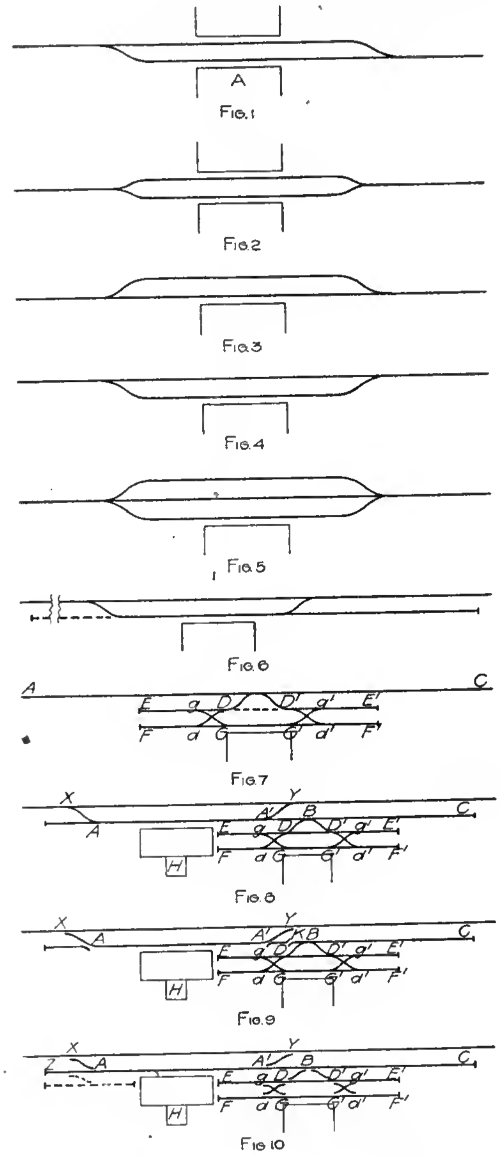
It would thus appear that there were objections to both types, and that the factor which determined the choice for any particular railway was the ratio of fast to slow trains on that railway. This would imply that, as fast traffic increased, the stations of a given railway should be changed from the first to the second type, and vice versa when the fast traffic decreased, a manifestly absurd proposition. Moreover, there is a general tendency on most railways to increase the number of fast trains. It therefore becomes necessary to weigh the objections of each type seriatim.

Taking first the platform on straight type, the reality of the danger of allowing a fast train to dash between a halted passenger train and the platform has been proved over and over again. As an argument it might not carry much weight in a civilized country such as England, where passengers and employees are well able to look after themselves. But in India, no amount of supervision is sufficient to keep foolish and careless passengers and employees from attempting to cross the intervening track in the face of an aproaching express. Time, also, is lost in side-tracking a stopping train to allow a through train to cross, and if time is limited the probability is that the stopping train will be allowed to remain at the platform, while the fast train is diverted over the loop—a dangerous alternative. Moreover, the long stoppage of a train on a siding facilitates evasion of the ticket collector, a drawback which, although not serious, must be considered as inherent in the type. There are thus three permanent objections to this type, while the sole feature in its favor is the straight run for all but crossing trains.

Considering next the platform on loop type, the sole objection to it is the lurch to which stopping trains are subjected on taking the turnout. This lurch, it is contended, is a three-fold evil. It is dangerous when turnouts are taken at excessive speeds, as often occurs when quick-acting brakes are used; it is always unpleasant; and it increases the wear and tear of the permanent way as well as of the rolling stock.

The risk of taking turnouts at excessive speeds is, however, a relative rather than a positive danger. As interlocking prevents the risk of splitting the points, the danger is confined to two sources, namely, the risk of the outer leading wheel of the engine mounting the switch, when the flange is unduly worn, and the overturning tendency due to the necessarily limited superelevation. In either case the risk depends on controllable factors, namely, the condition of the tires, the speed of the train, and the curvature, etc., of the turnout. A practical limit to the speed is derived from the fact that the driver has to bring his train to a standstill at the platform. This in itself is a safeguard, whatever arbitrary restrictions of speed over turnouts may be imposed, for experience shows that however prone a driver may be to ignore speed restrictions, stopping trains do not in practice enter turnouts at a greater speed than about thirty miles per hour. Accepting this limit, there would be no excuse for an engine mounting the switch if the wheel-flanges and the points were kept in reasonably good order, as they should be; in fact, even with flanges worn to a sharp edge, mounting is extremely unlikely to take place in ordinary practice.

With regard to the danger of overturning, or of broken springs, it ought not to be impossible to design a turnout capable of taking a train with safety at thirty miles per hour. On the Indian standard gauge (5 ft. 6 in.), with tracks 15 ft. apart, center to center, curves of about 1,600 ft. radius, with crossings one in twelve and switches 15 ft. in length, are frequently traversed by trains at thirty miles per hour (against rules, it is true) with impunity. If this is held to be dangerous the remedy would appear to lie in easier curves and longer switches, rather than in speed restrictions, for as long as the latter are imposed, much of the advantage of quick-acting brakes is lost, and train movements are unnecessarily hampered.



Different Station Arrangements.

But the author is inclined to believe that the standard, one in twelve turnouts, if scientifically laid out and fitted with 18 ft. or 21 ft. switches, and properly maintained, could be made available for much faster traffic than is at present allowed. In this connection the question of whether a certain amount of superelevation could be given at the points without detriment to the running qualities of the straight road is worthy of investigation. But these are technical details which need not be discussed here. They are alluded to merely for the purpose of indicating the possibility of improving the design of turnouts, so as to take trains comfortably at thirty miles per hour, without materially increasing the length of a station yard.

The foregoing remedies would also have the effect of mitigating, to a large extent, the discomfort of the lurch. The increased wear and tear of rolling stock and permanent way on the turnout is confined in the present case to the extra wear and tear caused by fast trains; but as the majority of the trains using the turnout would not be fast trains, the objection under this head is hardly worth considering.

A simpler remedy than any of the foregoing for the evils of the platform on loop type is suggested by certain existing practices. The first practice to which reference will be made is that on certain railways, when two passenger trains cross at a wayside station, the first train draws up at the platform as a matter of course (whether the platform is on the loop or on the straight), and the second train draws up on the second line, clear of the rear of the first train, where it is at once dealt with. The second train thus does not get the benefit of the platform at all, but, as far as the author has observed, no inconvenience is caused thereby, either to the passengers or to the staff, provided the space between the rails is leveled up and dressed with fine metal, and provided the platform is not inconveniently high. Where, as at many wayside stations, the platforms are of the "flush" or rail-level type, the second train suffers practically no disadvantages whatever over the first.

There is no danger in crossing the track in this case, because the crossing is done in rear of a train that has just arrived, so that no one can get run over unless the first train is backed. Even in the latter contingency the danger is very remote, for at worst the backing could only be due to shunting movements in front, the effects of which would not reach the rear of the train without timely and audible warning. The second practice to which it is desired to draw attention is the use of "flush" or rail-level platforms at many wayside stations. To the average third-class passenger of India a high-level platform is an unnecessary luxury. The carriage foot-boards afford all the facilities necessary for egress and ingress; in fact, on occasions when goods-wagons have to be employed for the conveyance of passengers (as frequently occurs when there is a shortage of carriage stock), it is found that passengers, whether male or female, have no difficulty in getting into them from any platform level. The author does not defend the practice of using goods-wagons for passenger traffic, but the fact is cited in support of the contention that, with proper coaching stock, raised platforms are not indispensable for wayside passenger traffic, either on the 5 ft. 6 in. or the meter gauge.

This point being established, and considering that trains are occasionally dealt with on the second line without inconvenience, the author ventures to suggest that if flush platforms were generally adopted at wayside stations, and extended up to the second track (as they might easily be) there would be no need to bring stopping trains on to the loop at all, except for crossing purposes. If this principle were accepted, the main objection to the platform on loop type of station would disappear altogether, as the loop would then be used only on special occasions, e. g., by the first of two passenger trains which have to cross, or by a passenger train crossing a goods-train. It would then only be necessary for the station staff to see that passengers waiting for a train did not spread themselves beyond the limits of what may be called the permanent or "waiting" platform, which might be slightly raised or otherwise demarcated to emphasize its functions. In short, if the three objections to the platform on straight type be set against the three objections to the platform on loop type, it is found that the former outweigh the latter at every point, for the former contain unpreventable elements of danger, whereas in the latter the danger element is reducible to one of discomfort only, and this can be mitigated or eliminated entirely by the method just suggested.

Position of Platform in Relation to Traffic. Assuming that the platform on loop type is adopted, the next question is whether it matters from which side of the main line the platform takes off. This question has also been ventilated, and the general consensus of opinion is thus summed up by Mr. C. W. Hodson:

(1) Fast or heavy traffic calls for continuous brakes, and the adoption of continuous brakes with fast traffic necessitates interlocked routing signals, which render it unimportant which side of the main line the turnout takes off.

(2) Consequently there is no need to put either the loops or the platform uniformly on any particular side of the line, but in the absence of any special reasons to the contrary the loop may preferably be put on the side on which the line will eventually be doubled.

As regards the latter portion of the second paragraph, the author has seen the principle of uniformity carried to extremes. One side of the line is selected for future doubling (a contingency usually more or less remote), and all platform-loops are placed on that side whether it suits the local traffic or not, with the result that in many cases a fairly important town, which has been keenly interested in the construction of the line, finds itself finally on the wrong side of its station, to which access can be gained only by means of a remote level crossing at the extreme end of the yard. In the opinion of the author, the more elastic principle of locating a platform on whichever side is more convenient to local traffic is preferable, in that it tends to foster better relations with the public, and simplifies the work of the traffic department, while it need not prejudice the question of future doubling; for supposing a loop to occur on the opposite side of the line to that selected for doubling, matters could easily be put right, when the need for doubling arose, by a local realignment involving a lateral deviation of 15 ft. one way or the other from the original main line. In the absence of any special reason to the contrary, it would, of course, be proper, as pointed out by Mr. Hodson, to put the loop on the doubling side. This would occur, for instance, when a crossing station serves half a dozen unimportant villages equally on both sides of the line.

Lie-byes. The location of a lie-bye, to meet the contingency of a slow train being side-tracked for a fast one in one direction, while another train is being admitted from the opposite direction will next be considered. From a traffic point of view, the simplest device would be a second loop on the offside of the main line, as shown in Fig. 5, but the paramount importance of safeguarding fast trains necessitates the use of some form of interlocking, so as to secure the isolation of the run-through line. Traffic conveniences must therefore be governed by the price which the administration is prepared to pay for their safety. Regarded in this light, it is evident that the fewer facing points there are on the main line, the cheaper the interlocking will be, and consequently the simpler the working, whatever system may be adopted. In fact, it may be taken as a general rule that it does not pay to have more than one set of interlocked facing-points each way in an ordinary wayside station.

This being the case, the type illustrated in Fig. 5, which has two sets each way, must be rejected as too expensive, although undoubtedly convenient, and it is therefore necessary to take the lie-bye off the platform loop. But as the platform prevents the lie-bye from taking the form of a second loop, the form eventually adopted is necessarily that of a long dead siding, as shown in Fig. 6. This is the type now generally adopted on state railways, and is the cheapest form from the point of view of [illegible]. The shunting of a train into the lie-bye and its subsequent extrication are tedious and troublesome operations, and in some cases a certain amount of maneuvring is required, as, for instance, when a stopping passenger train from the left and a slow goods-train from the right arrive in succession, and the latter has then to be side-tracked for a fast through train from the right; in fact, in this case, if pressed for time the goods-train could not be got into the lie-bye without great delay, and the probability is that, in order to save time, the passenger train would have to go there while the goods-train occupied the loop. Such cases, however, are usually rare, and the temporary inconvenience involved has hitherto been accepted as inevitable. The inconveineince would still exist even if the lie-bye were placed in the alternative position shown by the dotted line in Fig. 6, or in both positions. On this point the author will have something more to say later on.

Goods-Yards. On the question of the development of a local goods-traffic various opinions have been held, some officers being in favor of having the goods-shed opposite the passenger platform, so as to be under the eye of the station master, rather than on the same side, where it would necessarily be some distance off, imposing on the station master a certain amount of trouble and loss of time in walking backwards and forwards, with the alternative of neglecting either the goods work or the station work. On most wayside stations of this class the superior staff consists only of a station master and his assistant, who work by relief, only one being on duty at a time; and the man on duty has to combine the duties of train signaler and goods clerk. Two or three menials complete the establishment. There is thus no doubt that a goods-shed opposite the station building would be more convenient, from the station master's point of view.

This arrangement, however, means a reversion to the type shown in Fig. 5, which has been shown to be too expensive, by reason of the extra interlocking involved. Moreover, from the point of view of the public, if the passenger platform is on the natural passenger traffic side of the line, as it ought to be, the natural goods-traffic will almost invariably be on the same side. Therefore, the type shown in Fig. 5 would be not only too expensive, but unsuitable to the public. Hence the predilections of the station master have to give way to the combined exigencies of economical working and public convenience; and if it is found in a rush of traffic that one man cannot efficiently attend to both the station and the goods work, the proper remedy would be to engage an extra man temporarily. Thus at every turn the design of a station yard of this class involves a choice of evils; and having arrived at the conclusion that the goods-yard must usually be on the same side as the passenger platform, the next step is to consider how it should be laid out.

In many cases the steps taken for creating a goods-traffic are tentative, in the first instance, and very often an extensive traffic is developed from very small beginnings. It is therefore very desirable that the first sidings laid down, however modest, should form part of the future design of a fully developed yard. The goods-shed has to deal with both outward and inward traffic; therefore the sidings should be so arranged that a goods train from either direction can readily detach and pick up wagons, whether loaded or empty, from suitable sidings in the neighborhood of the goods-shed. Let B (Fig. 7) be a point on the train siding $A\ B\ C$ opposite the goods-shed $G\ G'$. An engine arriving from A with wagons to be detached would draw up in $B\ C$, clear of B, then shunt back over a cross-over $B\ D$, giving direct access to two sidings $D\ E$, DdF, one of which would be kept clear to receive the "inward" wagons, while the other would contain the "outward" wagons, previously assembled in readiness to be attached. Thus, with a minimum of shunting and in the shortest possible time, the engine would have detached its inward and attached its outward load, and returned to $B\ C$ ready to rejoin its train in $A\ B$, and thence proceed on its journey. Similarly, a train arriving from the direction of C would require a corresponding cross-over $B\ D'$ and sidings $D'\ E'$, and $D'd'F'$. It only remains to provide access from both sets of sidings to the goods-shed. This can be done most compactly by providing a platform line $d\ G\ G'd'$ and inserting scissors cross-overs Dd, Gg, $D'd$ and $G'g'$. The movements of individual wagons between the platform and the various sidings would, of course, be effected by hand shunting.

On the North Western State Ry., where this type of goods-yard is in vogue, the sidings are long enough to hold, say, fifteen wagons each, and the platform line a similar number. If further platform accommodation is required one of the scissors cross-overs is simply moved further out, say, to double the distance, and the platform line is extended to hold thirty wagons. Ordinarily, not more than fifteen wagons are ever likely to be received or dispatched in one direction at a time, so that dead sidings long enough to hold fifteen wagons each are found to suffice, but a platform of double that capacity may be necessary in case of up and down traffic being equal in bulk at any time, as sometimes happens. Further accommodation may be given by joining up $D\ D'$, as shown by the dotted line.

For stations in embryo the portions $F\ G$ and $F'\ G'$ and the cross-overs Dd and $D'd'$ are omitted. In the earliest stages, when the traffic prospects do not amount to more than one or two wagons a day in either direction, no platform is provided, and the "yard" consists of a single cross-over $B\ D$ or $B\ D'$, leading from the train line to a short siding $E\ E'$ on which all traffic is dealt with. If a shed is required, it is made portable, so as not to prejudice future extensions.

Accepting Fig. 7 as the normal type of goods-yard, based on common sense principles, the next step is to fit it into the station plan, Fig. 6. It has already been shown that it must be on the platform side. The first device that suggests itself is to merge the approach siding $A\ B\ C$ of Fig 7 into the lie-bye in Fig. 6. This is, in fact, what is usually done, the only objection to it being that, in a certain contingency, already alluded to, a goods train on arrival might find the lie-bye occupied by a passenger train, the main line being cleared for an expected through train. If such a contingency is likely to be of frequent occurrence, a second lie-bye can easily be put in, as shown by the dotted line in Fig. 6, and one of these lie-byes, say, the right-hand one, reserved as the base of the goods-yard. Usually the second lie-bye is not necessary, a short dead siding being sufficient there as a trap.

The yard will then finally take the form shown in Fig. 8. The minimum distance between the station platform and the near end of the goods platform is fixed by the length of the sidings $D\ E$ and $G\ F$, which must be at least equal to the length of fifteen wagons plus the length of the scissors cross-over. The station platform being 600 ft. in length, the distance from the station building H to the nearest point of the goods platform G, amounts to about 850 ft., on the standard gauge. Hence, if the goods platform is 720 ft. in length (sufficient for thirty wagons) the station master's average walk from the station building to the center of the goods platform is 1,210 ft. which in the hot weather might be traversed in five minutes.

Interlocking. The means by which such a yard can be interlocked have still to be considered. On the North Western State Ry., where the List and Morse key-locking system is in use, the goods-yard is trapped at K, between A' and B (Fig. 9), and the points A and A' are kept normally locked off the loop, and cannot be unlocked and set for their respective dead sidings when a loop-signal is lowered at the facing points X or Y of the main line. The result is that no train can be admitted directly into a dead siding from the main line. It has to be brought first on to the loop, where it then has to wait till the

desired road is made. This is done in the following manner: The points A' and the trap K are set and locked normally, as shown in Fig. 9, by means of a Hepper double-key lock at K and a single-key lock at A'. To set the points for the siding, a key, called the "station key," is obtained from the station master, the issue of which locks the loop-keys, thus preventing loop-signals from being lowered while the "station key" is in use. This station key is taken to the double lock at the trap K and inserted in its proper hole and turned. This releases the switch, which must next be reversed and set for the siding. This releases a key, called the "points key," from the other compartment of the double lock. The extraction of the points key prevents the trap from being again reversed, and so locks up the station key for the time being. The points key is then inserted and turned in the lock at A', thus unlocking the points, which can then be reversed and set for the siding. This reversal locks up the points key, so that when the siding is in use neither the points key nor the station key can be extracted and no loop-signal can be lowered. Consequently, if it is desired to admit a running train on the loop, the siding must first be restored to its normal setting and locked off the loop, and the station key returned to the station master before the key for the loop signal can be issued.

It will be understood from the foregoing that any key locking system, although securing at small cost the absolute safety of the running lines, entails a certain amount of delay in bringing the siding into use, and again in restoring it to its normal setting. A rodding system would be more expeditious, but the cost would usually be prohibitive for wayside stations. These drawbacks are beginning to be realized more and more every day. The more complete the interlocking, the more paralyzing is its effect on ordinary traffic operations. The safety of through trains is secured at the expense of station to station traffic. If the interlocking is only partial, ordinary traffic may be expedited, but the security of through trains is no longer guaranteed. On a certain Indian railway, where platforms are almost invariably on the main line, and a second loop takes off the first, the interlocking is confined to the facing points on the main line. Sidings are not trapped, and the only protection is that afforded by the use of Scotch blocks, which may or may not be left open. This cannot be considered a satisfactory state of affairs, but there are only two fast trains a day each way on this line, and as long as these suffer no mishap there is a tendency to be satisfied with existing arrangements, especially as they facilitate the handling of ordinary traffic.

Suggested Modifications. While it is illogical to aprove of partial interlocking, it must be admitted that excessive interlocking sometimes constitutes a serious inconvenience in a rush of traffic. It raises the question whether, after all, a little elasticity should not be permitted in applying to wayside stations some of the tenets of interlocking, which in their entirety constitute a "counsel of perfection" difficult to attain in practice. For instance, the first golden rule of interlocking is the complete isolation of running roads, and the second is the trapping of all lines leading from goods lines and sidings to the running roads. Both these conditions are fulfilled in the North Western State Ry. type of wayside station, the running roads being the main line and the loop. But the isolation of the loop as well as the main line throws difficulties in the way of handling ordinary traffic. Reference to Fig. 9 will show that a train on the lie-bye must be completely locked in before another train can be admitted into the loop. The author contends that as long as the lie-bye is used only by bona fide trains, i. e., trains consisting of vehicles coupled to one another and attached to an engine in steam, it is not necessary to lock it off from the loop, as with such trains there would always be a responsible man at the near end.

If this point is conceded, it is possible to introduce the simple arrangement shown in Fig. 10, where the erstwhile loop becomes a disconnected line, to which access from the main line is gained by cross-overs XA, YA' from the facing points X and Y. Each cross-over would be rodded and worked by a single lever in the same way as simple facing points, whatever system of interlocking were used, the only difference being that the moving of a cross-over would involve a slightly greater effort than the moving of a single set of points. The only extra rodding necessary would be that required to connect X with A and Y with A'. The safety of fast through trains is secured as before.

It only remains to consider what risks may be incurred by a stopping train entering the loop. The first risk is that the cross-over may be reversed too soon after the train has cleared the facing end, which may be unlocked immediately after its passage, and before it has cleared the trailing end, which it would not be practicable to lock. But no more serious accident than burst trailing points would ensue from that remote contingency; and even if these burst trailing points were not detected before the next loop train from the opposite direction entered them facing, the ensuing derailment would not be serious nor likely to foul the main line. Point indicators would, of course, be used. The only other risk is that of runaway wagons fouling the loop. As regards this contingency, there would never be any occasion, nor any inducement (even if there were no orders on the subject) to stable wagons on the lie-bye siding A' B C; and the short dead siding A Z is merely intended as a trap, although possibly a short siding for spare carriages might be connected with it by a cross over, as shown by the dotted lines. Hence, if any loose wagons escaped from the goods-yard they could only get on to the lie-bye when the cross-overs B D, B D' were set for that line. It would then require a wind blowing in the direction C to A or a falling gradient in that direction to cause these wagons to foul the loop.

The gravitation factor of the problem could be met by making the cross-overs B D, B D' fall, say, one in fifty towards the goods-shed sidings, putting the latter at a lower level. As a further precaution the lie-bye might be given a slight fall from A' to C, but this is not altogether desirable, as trains using it would have difficulty in getting out again. It is better that it should be level. Runaways can then be caused only by a sufficiently strong wind blowing from C to A. Wind in this direction would not affect the wagons on the sidings E and F, but it might start those in the sidings E' and F'. The conditions for a runaway then would be (1) the cross-over D' B must be set for the sidings, (2) there must be loose wagons in one of the sidings E' and F', (3) the Scotch blocks must be open, (4) the wind must be in the direction C to A, and must be sufficiently strong to blow wagons up the one-in-fifty gradient over D' B. Hence if any one of the foregoing factors can be circumvented the problem is solved, and there can be no runaways. To circumvent the first three factors, by interlocking or otherwise, would be costly; but the fourth can be nullified by the simple device of erecting a wind-screen to protect the sidings E' and F', if they are not already sheltered by existing local features.

It will be seen that the station is now so interlocked that the safety of the through line is absolutely, and of the loop practically secured, while access to the lie-bye and goods-yard can be obtained at all times without the delay entailed under the systems previously described, where the lie-bye and goods-yard are normally locked off from the loop, as shown in Fig. 9. Moreover, it will be seen that as long as the loop is not required for a running train (which would be the normal state of affairs) the lines B A and B C (Fig. 10) form perfect isolated shunting necks for goods-trains in both directions.

It is true that when a passenger train is halted on the main line opposite the platform the portion of neck B A available for shunting purposes would be temporarily curtailed, so as not to screen the passenger train. But as shunting operations could be suspended at any instant at a sign from the station master this arrangement would present no traffic difficulties. The great advantage is that there are no interlocked traps or points to prevent the siding from being available for use at any moment, and thus a great saving of time is effected when there is any shunting to be done.

This type (Fig. 10) involves a quasi-infringement of the interlocking rules, which prescribe generally for the protection of running roads, without reference to their individual importance. But, as in wayside stations the main line alone is used by fast through traffic, the protection of which is the raison-d'etre for interlocking, while the loop is used only by stopping trains, for which the protection afforded by interlocked traps would not ordinarily be considered necessary, it appears to be a reasonable compromise, in this class of station (assuming that the exigencies of shunting preclude the general adoption of the more perfect type, Fig. 9), to treat only the main line as a running-road for interlocking purposes.

Dead Sidings vs. Loops. The inherent defect of the dead siding form of lie-bye is the delay involved in backing a train into or out of it. When traffic is heavy, such delays mount up. Even with the simplest system of interlocking, the time spent by a heavy train in entering and emerging from a dead siding is almost equal in many cases to that which it would occupy in running between two neighboring stations. On account of this defect, although a yard arranged on the plan just described would reduce the delay to a minimum, traffic officers do not take kindly to the dead siding principle for crossing purposes, and would welcome any loop system that combined facility of movement with safe working. Where the platform is on the straight, it is customary for a second loop to take off the first, and, although in the absence of efficient trapping this arrangement is not conducive to the safety of fast through trains, it undoubtedly saves time when three trains have to be dealt with. It is worth while considering, therefore, whether a second loop can be provided without sacrificing any of the principles involved in the adoption of the type shown in Fig. 10.

Accepting the two hypotheses that a raised platform is not necessary and that tracks may intervene between the "permanent" platform and a stopping passenger train, it would be easy, by setting back the permanent platform another 15 ft., to introduce a second loop between the first loop and the platform. The straight would still be used, in the ordinary course, for the reception of trains, passengers merely having to cross two intervening tracks instead of one; and for the crossing of two trains the straight and the first loop would be used as before. But when three trains have to be accommodated there is no doubt that the second loop would be used on all occasions in preference to the lie-bye. The latter would thus become a goods-siding only. In the case of side-tracking a goods-train and a passenger train, the passenger train would take the platform line and the goods-train the middle line.

as a matter of course, no matter which train arrived first. The goods-train might even be able to carry on its shunting during the interval.

The second loop therefore presents considerable advantages, but it is doubtful whether it could be safely used without complicating the interlocking arrangements. Supposing the interlocking to be initially confined to the facing points of the main line, combined with the use of coupled cross-overs, as described in connection with Fig. 10, the insertion of a second loop would involve two sets of facing points for all trains turned off the main line. If such trains had continuous brakes, it would certainly be necessary to ensure the correct setting of the second facing points before the loop signal was lowered. This could only be done by extending the system of interlocking so as to provide for three-armed interlocked signals at the main line facing points, the third arm referring to the second loop. The expenditure involved in such extra interlocking would not be justified except perhaps at selected stations of growing importance.

But in laying out a new line of railway the future development of wayside stations can never be foreseen with any certainty. It has often happened that a station which has originally been inserted midway between two other stations merely for crossing purposes, and for no other reason, has subsequently developed a local traffic which has necessitated in the course of a few years its expansion out of all recognition. It is therefore necessary, when first laying out a station, no matter how insignificant its traffic prospects may appear at the time, to allow for future development. The author therefore ventures to suggest that when the platform on loop type of station, as shown in Fig. 9 or Fig. 10, is adopted, the permanent platform should be set sufficiently far back to enable a second loop to be put in at any future time, if found necessary. This involves merely placing the station building about 15 ft. farther back than it would otherwise be in the first instance.

In conclusion, the author desires to acknowledge the assistance afforded him in the preparation of this paper, not only by personal intercourse with various railway officers in India, but also by the various publications of the late Technical Section of the Indian Public Works Department, issued under the personal direction of Mr. C. W. Hodson, C. S. I., M. Inst. C. E., late Secretary to the Government of India for Railways.

AN AUTOMATIC RAILWAY CROSSING GATE for electric railways is in use on an interurban electric road near Montreau, Austria. It is a light pole pivoted in a small housing at one side of the roadway, and counterbalanced so as normally to stand vertical. It is operated by a 1-10 h.-p. series-wound electric motor, using current from the trolley wire. The motor is mounted in the housing above the axis of the gate and drives through a reduction gear a worm, on which a cable may be wound. The cable is fastened at one end to the counterbalance weight of the gate and at the other to the worm, the action of the motor being to wind up the cable and raise the counterweight, thus lowering the gate. The last few turns of the worm are of rapidly increasing radius, so that, at the end of the wind, the increased leverage stops and holds the motor; when the current is cut off, the motor releases and the counterweight unwinds the cable and raises the gate. Operation of the gates is rendered automatic by an auxiliary wire, which is strung beside the trolley wire near the crossing, so that the bow collector of the car, in approaching, makes contact with it and admits current from the trolley wire, the auxiliary wire connecting with the motor, which holds the gate down as long as the car is [illegible] the crossing.

Diagrams to Determine the Bearing Power of Piles.

By G. F. Stickney, M. Am. Soc. C. E.

Many structures of the New York Barge Canal must necessarily be built on pile foundations, which will be located in earth of variable supporting power. In the preparation of the plans and specifications, the piles are spaced so as to have a certain maximum loading, and provision is made for driving test piles to determine the length required to bear this load.

In order to secure uniformity in conducting these tests, the following instructions were prepared and Diagrams 1 and 2 were constructed to facilitate the work in the field, as, by their use, the safe load for any pile may be instantly determined.

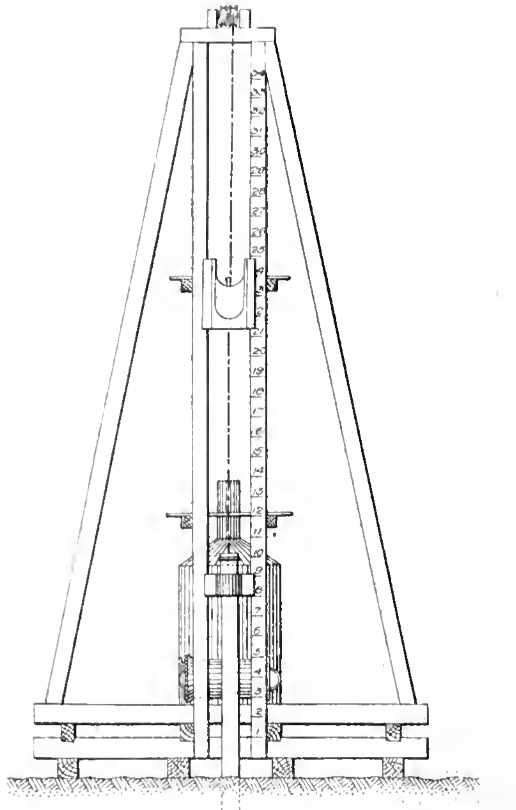
Instructions.—Where test piles are driven, to determine the length required in foundations of structures, the safe load will be determined by the following formulæ:

1. For drop hammer $L = 2wh \div (s + 1)$.
2. For steam hammer $L = 2wh \div (s + 0.1)$.

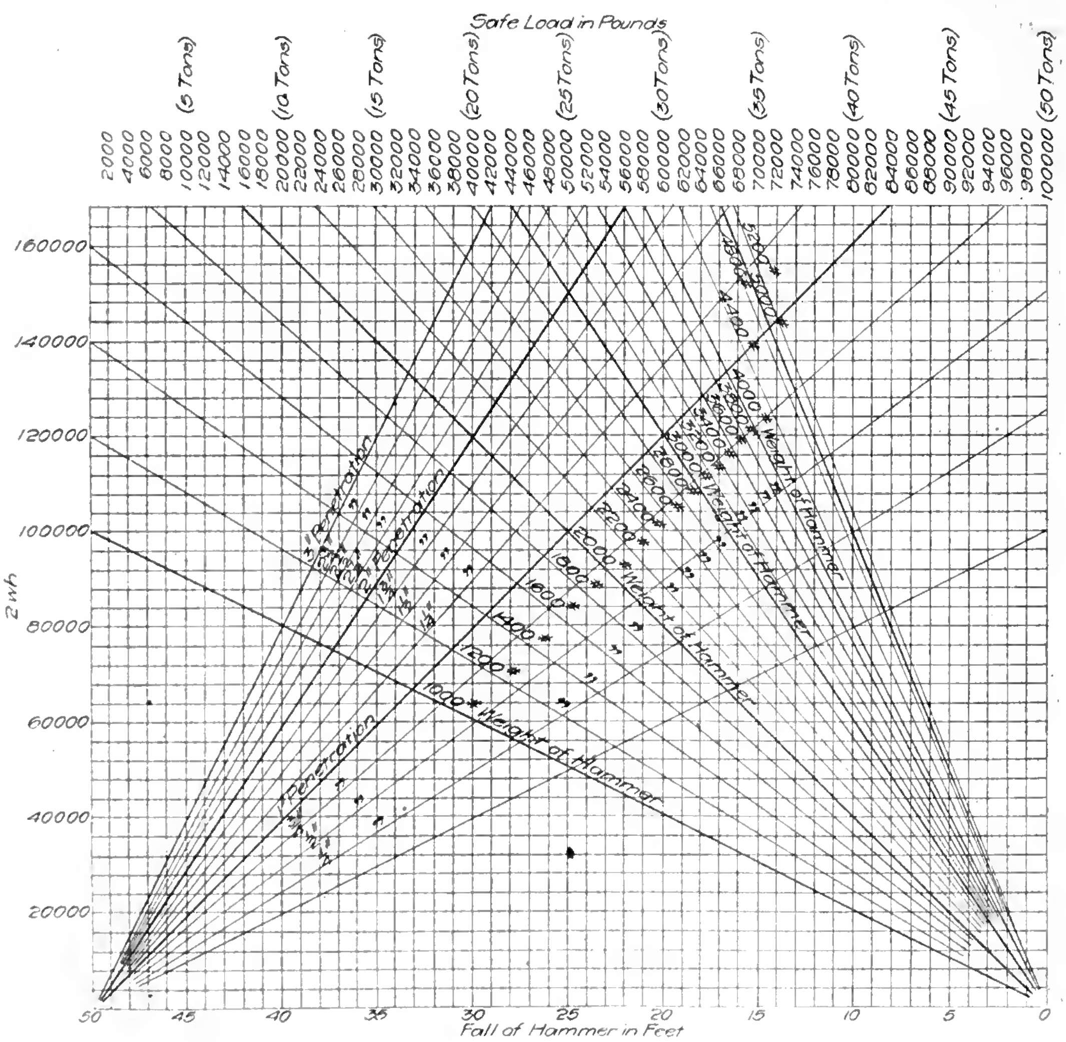
Where L = safe load, in pounds; w = weight of hammer, in pounds; h = fall of hammer, in feet, and s = penetration under last blow, in inches.

The required load is indicated on the plans and in the specifications.

Test piles must be driven in the foundation,



Pile Driver for Testing.



Safe Load on Piles Driven with Drop Hammer.

Follow the diagonal line for the weight of the hammer to its intersection with the vertical line giving the fall of the hammer; from this point follow the horizontal line to its intersection with the diagonal line giving the penetration; from this point follow the vertical line to the top of the diagram where the safe load is stated.

after the same has been fully excavated. One test pile shall be driven for each 500 piles, or less, in the structure, but not less than three piles, of each class, for each structure, and they shall be located so as to develop the conditions over the entire area.

If the test is to be made with a drop hammer, mark the leads of the pile driver in feet (as shown on the accompanying sketch) and ascertain the weight of the hammer. Select a pile somewhat longer than the probable length required and drive same. When the penetration under each blow becomes approximately uniform and but a fraction of a foot, stop the driving and let the hammer rest on top of the pile.

Make a pencil mark on the leads just at the

bottom of the hammer and note the position, as indicated by the scale on the leads.

Now instruct the engine runner to strike ten blows on the pile, raising the hammer to about the same height (15 to 20 ft.) each time, before letting it fall.

Stand in front of the pile driver and note the height reached by the bottom of the hammer before each blow.

On the completion of the ten strokes average the height reached by the hammer.

Let the hammer rest on top of the pile and make a second pencil mark on the leads.

Find the average fall of the hammer by taking the mean of the two pencil marks, on the scale of the leads, and deduct from the average height reached by the hammer. Measure carefully, with a rule, the distance between the pencil marks, in inches, and the result is the total penetration of the pile under the ten blows of the hammer.

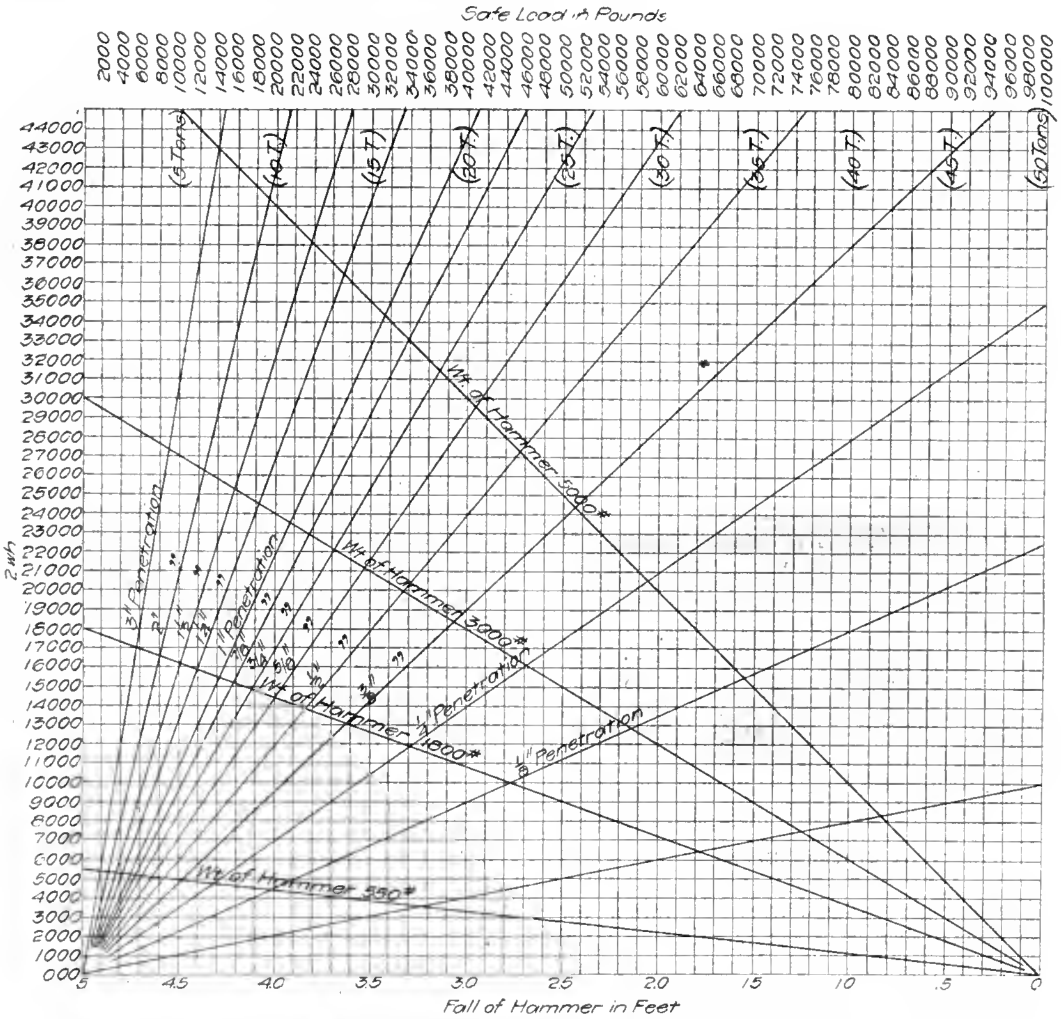
Assume that one-tenth of this amount is the penetration under the last blow.

The weight of the hammer, the fall of the hammer and penetration under the last blow are now known and the safe load may be calculated by the formula, or may be taken off Diagram 1.

Repeat the process, if necessary, until the pile is driven to a depth that gives the required supporting power. Measure the length of pile extending above the plane of the cut-off and deduct from the original length of the pile; the result is the length required.

If the test is to be made with a steam hammer, no particular preparation is necessary beyond learning the weight of the striking part and the normal stroke of the hammer.

The average penetration under ten blows of the hammer should be used as above, and the safe load may be determined, either from the formula or by Diagram 2.



Safe Load on Piles Driven with Steam Hammer.

Follow the diagonal line for the weight of the hammer to its intersection with the vertical line giving the fall of the hammer; from this point follow the horizontal line to an intersection with the diagonal line giving the penetration; on the top of the vertical through this point will be found the safe load.

Book Notes.

A third edition of Mr. Chas. H. Sames' "Pocket-book of Mechanical Engineering" has just appeared. Previous editions were noted at some length in this edition, and it is only necessary to say that in the new edition of this valuable little pocket-book, information has been added concerning high-speed tool steel, based upon the well-known paper presented by Mr. F. W. Taylor before the American Society of Mechanical Engineers a year ago, on the specific heat of superheated steam, on several features of machine design, and on reinforced concrete, the information under the last head being largely based upon the report of the British Committee on reinforced concrete. This pocket-book is sold at $2 by the author, whose address is 542 Bramhall Ave., Jersey City, N. J.

In February of this year, Dr. W. Michaelis read an interesting paper before the thirtieth annual meeting of the Association of German Portland Cement Manufacturers, which has just been translated by his son and published under the title of "The Hardening Process of Hydraulic Cement." It is an explanation of the more important experiments Dr. Michaelis has been conducting for many years for the purpose of ascertaining what phenomena occur when cement hardens, and gives various deduction from these experiments which may be summarized in the following quotations from the monograph: "All the phenomena are easily reduced to and found to be based upon the following two processes: 1, Formation of a colloidal, fundamental substance, composed of calcium hydro-silicates, calcium hydro-aluminates, and calcium hydro-ferrites, which forms the characteristics and essential part of all hydraulic cements and is the cause of their hydraulicity. 2, Formation of crystalloids, as for instance, calcium aluminates, calcium sulphates, calcium and magnesium carbonates and calcium sulpho-aluminates, which as a rule increase, even sometimes considerably increase, the strength of the ground mass in which they are embedded, but which at the same time cause formation of cracks within the hardened colloids, thus admitting solutions and leading to destruction; in other words, existence of properties of crystallation, which are the cause of instability and short life of the hydraulic cement." (Chicago, Cement & Engineering News, 50 cents.)

There are few subjects now attracting more attention from engineers interested in the maintenance of railway track than that of the effect of trains upon rails and their fastenings. The Pennsylvania Railroad Co. is now conducting elaborate tests to ascertain just what is the effect of both steam and electric locomotives on tracks, and when the results of this investigation are made public, the information will be of the highest value. Until then, the engineer will find the most experimental information on the subject in the valuable monograph by G. Cuenot, which has recently been translated by Mr. W. C. Cushing, chief engineer of maintenance of way of the Pennsylvania Lines West. This monograph, entitled "Deformation of Railroad Tracks and the Means for Remedying Them," gives the results of many experiments on the lines of the Paris-Lyons-Mediterranean Ry. This method of securing information is the direct opposite of the elaborate theoretical studies based on assumptions which have been made by a number of German engineers. The deformations studied include creeping, the reduction of gauge on tangents, the spreading of gauge on curves, the compression of tie at its supports, the tearing out of screw spikes, the poor holding of the joints, and the vertical deformation of the rail. The investigations indicate, according to the author, that these deformations are due mainly to the bending of the crosstie and the longitudinal movement of the tracks. The experiments further indicate that the portion of the tie which actually transmits an appreciable load to the ballast is quite limited, extending 13 to 16 in. from the point of application of the load in the tests under consideration. The author believes that the rail joint should be redesigned and supported by a tie, on the ground that elasticity is given to the track by the tie, by the sinking in the ballast and the roadbed. The best results, in his opinion, will be attained by the use of a strong composite crosstie consisting of relatively short ties of wood, one under each rail, connected by suitable bars and reinforced by steel plates. This tie can be made so as to give a stronger and more elastic track than the usual form, he states. It is evident that these conclusions will not be accepted by most American engineers until they have been thoroughly studied and submitted to further tests, yet the monograph is such a valuable contribution to the subject of track deformation that it deserves a very careful study. (New York, The Railroad Gazette, $2.00.)

Letters to the Editor.

HOW CONCRETE FAILURES CAN BE AVERTED.

SIR: There are three vital points that should be taken into consideration by the owner before placing a reinforced concrete building contract: First, the design; second, the inspection of materials; third, the execution of the work.

As a general rule, the owner knows but very little about the theoretical design of structures. He has in mind the type of building, the spac-

ing of columns and the story heights, and a general idea of the outside appearance, elevation, sizes of windows, etc. The structural design should be handled by an engineer—always an engineer—and always one with a history behind him of successful work in reinforced concrete. By successful, we mean an engineer whose records of design are not records showing a long series of experiments dotted here and there with failures, but rather a record showing a large number of buildings without a failure. The owner should carefully examine these records before he places his order for design.

The logical place of doing blacksmith work on steel reinforcement is in a central blacksmith shop, where men are constantly employed on the same line of work, and not on the job using labor that is not familiar with the construction and where shop facilities are few. The steel work for beams and girders should be fabricated into frames and shipped to the job complete ready to drop into the forms. Bearing these ideas in mind, the owner can rest free regarding a correct design.

In order to reduce inspection work on the job, the simplest system of steel work should be selected. The simplest system is essentially a built-up girder and beam system shipped to the job ready for placement, thus throwing the blacksmith inspection at the shop where it belongs. The cement used on reinforced concrete should be carefully tested, preferably at the mill, so that cement when it lands on the job is ready to use. The inspection of the work in progress should be made by a man thoroughly familiar with cement, concrete and steel reinforcement.

The owner should restrict the bidders to reliable contractors with good financial backing, who have successfully executed a number of reinforced concrete contracts. The contract should be finally placed with a firm thoroughly versed in every phase of reinforced concrete construction. If owners who are contemplating the erection of reinforced concrete structures will adhere strictly to the points related above, the possibility of failure will be a minimum.

Very truly yours,

E. N. Hunting.

Youngstown, Dec. 10.

Failures of Steel Beams.

Sir: I have recently had a peculiar experience with some structural steel which I think may be of interest to your readers. I am constructing a power house at Fall River, Mass., for the American Thread Co., and used for the boiler house roof 65-lb., 20-in. standard I-beams, their length varying from 25 to 30 ft.

In unloading the first shipment of these beams they were rolled off the side of a flat car, falling about 4 ft. onto level soft earth. One of the beams was broken as shown in the illustration herewith. The break was perfectly straight and extended from one flange, through the web, to the opposite flange. The fracture was perfectly new and showed no signs of defects. It was also found that a crack had developed from some rivet holes in the top flange, running from the rivet holes to the outside of the flange.

In handling two other beams of this same shipment they were tipped off some timber rolls, dropping about 6 in. to the ground, and in handling in this way the beams developed cracks in one of the flanges, in each case through a section where rivet holes had been punched. These cracks extended from one side of the flange to the opposite side and into the web slightly.

The manufacturers of these beams examined them, took samples from them and reported in a few days that they were absolutely unable to assign any cau e for the beams acting in this peculiar way, that both chemical and physical tests showed them fully up to standard specifications.

I decided to use the balance of the shipment that showed no signs of fracture, after testing them under full load conditions. In order to do this I built a platform and loaded it with brick, and then placed a beam under the platform and raised the load on it, thus bringing the maximum strain upon these beams. They all withstood this test, even the ones that had cracked through the flange, and as I was in a great hurry to get the roof on the boiler house I accepted them and have used them. The three beams that showed rupture have been replaced.

I had chemical analyses made of the beam that cracked, taking samples from twelve different points, Nos. 1, 2 and 3 being at one end; Nos. 4, 5 and 6 at one side of the crack, Nos. 7, 8 and 9 at the other side of the crack, and Nos. 10, 11 and 12 at the second end. These analyses are as follows:

No.	C.	Mn.	P.	S.
1	0.21	0.60	0.102	0.045
2	0.21	0.61	0.099	0.048
3	0.21	0.61	0.1004	0.059
4	0.22	0.64	0.111	0.054
5	0.21	0.62	0.112	0.052
6	0.21	0.65	0.133	0.071
*7	0.22	0.66	0.123	0.065
8	0.19	0.64	0.131	0.062
9	0.22	0.65	0.133	0.06
10	0.19	0.61	0.114	0.057
11	0.23	0.62	0.137	0.064
12	0.22	0.63	0.133	0.073

*A determination of the silicon at this point was also made, giving 0.014.

These analyses all show very high percentage of phosphorus and it seems to me this is where the trouble lay.

A Cracked Beam.

I shall be glad to know from your various correspondents whether or not they have ever experienced anything of this kind with structural steel, and I would also like to know if there is any way that one may be sure of not putting such material into structures. It seems to me there ought to be some method devised so that each and every beam could be carefully tested, if we are going to receive such material from reputable manufacturers.

Yours very truly,

Samuel M. Green.

Holyoke, Mass., Dec. 14.

Power Development near Chattanooga.

Sir: Referring to the description in the Dec. 7 number of The Engineering Record, of the Chattanooga & Tennessee River Power Co.'s plant, we wish, as consulting engineers for W. J. Oliver, to correct certain statements made in this article concerning the conditions governing the construction of the work and the progress made.

The matter of the fulfillment of the contract made between Anthony N. Brady, of New York, the banker financing the work, and W. J. Oliver, the contractor, is now in dispute, and all of the work has been temporarily shut down until the differences are adjusted. The original contract between these two parties was signed in October, 1905, but little progress was made for a year and a half, due principally to high water. It might be noted here that during the past year slack water navigation on the Tennessee River was possible during the entire year. This is the first time on record that such was the case.

In the spring of this year, the Power Company realizing that, through no fault of the contractor, it would be impossible to complete the work within the specified time limit of two years, made a supplemental agreement extending the period of time 20 months from May 10, 1907. It was specified in this contract that a superintendent should be employed by the contractor, acceptable to the engineer, and at the suggestion of Col. John Bogart, engineer for Mr. Brady and consulting engineer for the Power Co., such a man was employed. Little progress, however, was made under his management, until finally, in August, the contractor supplanted this superintendent with a man of his own choice, and since that time the work has progressed rapidly.

In your description of this plant it is mentioned that at the time of writing (middle of October) "the only evidences of progress are shown in the partly completed core wall for the embankment and a coffer dam for the lock, which has been raised to only 10 ft. above low water mark." Referring to the records of this work, I find that the entire core wall was completed Oct. 5, and the photographs shown of the wall, lock, basin and cableway tower were taken about August 10, instead of at the time of writing. On Oct. 15 there had been installed a complete contractor's plant, costing several hundred thousand dollars, and on that date 450 men were on the contractor's pay roll.

At the present date all the lock excavation is completed, it having been found necessary to go 6 ft. below the grade called for by the plans. Extensive quarries have been stripped and opened up, and derricks erected and 5,000 cu. yd. of stone taken out. A railroad three miles in length to the dam was completed Nov. 20. This road was graded and rail laid in six weeks. I might add that the soundings and test pits showing the depth of rock were inaccurate, and this caused considerable delay in the construction of the coffer dams. It was necessary to extend the foundation in the core wall 17 ft. below the original foundation line shown on the profile, and a bed of indurated gravel over-lying the lock had an average thickness of 15 ft. instead of 7 ft. as shown.

The work on the south side of the river has likewise made good progress during the past three months, and at the present time the tail race, forebay and power house foundation have been excavated to an average depth of about 20 ft. The delay in this work was caused by increasing the cross-section of the embankment from a 2:1 slope to a 4:1 slope, requiring a large additional amount of earth excavation to be raised a distance of 60 ft. to place on this embankment, whereas this earth, as contemplated on the original plan, could have been wasted. This embankment is partially completed, and, as previously mentioned, the concrete core wall of the embankment was completed Oct. 5.

The writer, accompanied by Major Thos. B. Lee, of Charlotte, N. C., chief engineer of the Southern Power Co., has, during the past week, made a thorough inspection of the work done and of the contractor's plant installed and we are both of the opinion that the work has made reasonable progress, considering the conditions which have been encountered, and that the plant is a complete one, in excellent working condition (most of it being new) and entirely adequate for the purpose intended.

I do not wish to go through the merits of the case now, but I think it is only proper that the conditions of this work be correctly set forth.

Very truly yours,

Washington, Dec. 14. Francis R. Weller.

AN IMPORTANT CONTRACT FOR MASONRY AND EARTHWORKS.

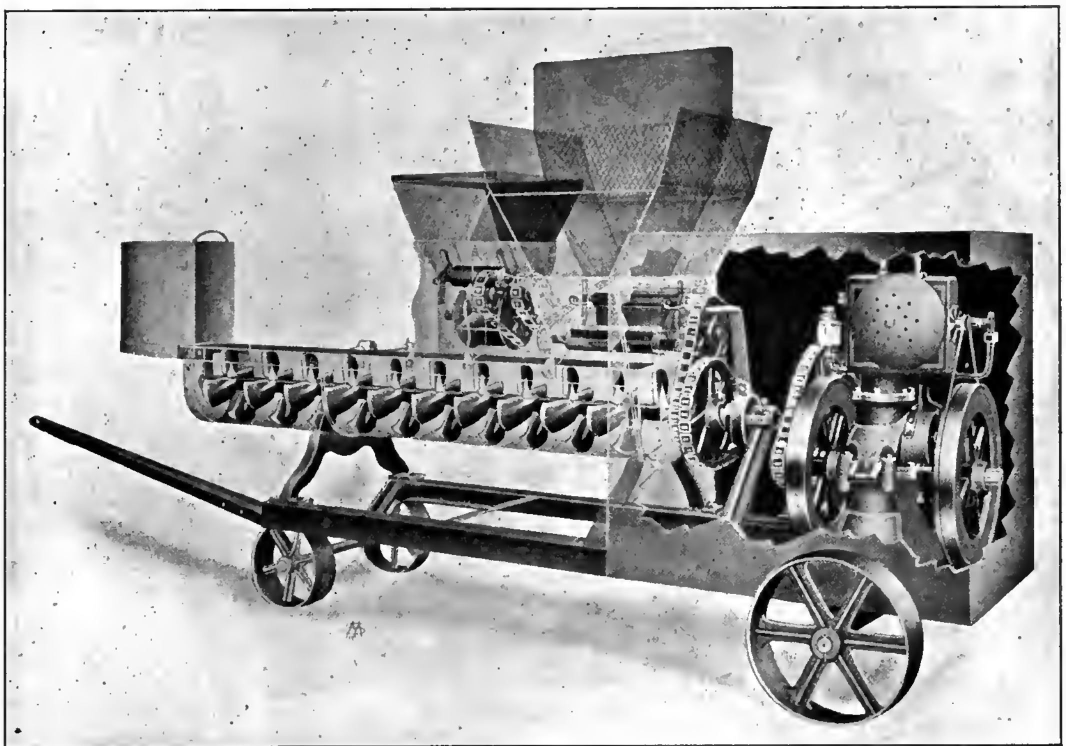
The Board of Water Supply of New York City has called for bids on the largest single contract ever undertaken by an American city, except that for the coonstruction of the first New York subway. It is for building the great masonry and earth dams of the Ashokan Reservoir in the Catskill Mountains, which were briefly described in this journal on May 11 The terms of the contract contain a number of very important innovations which are likely to make the work unusually attractive, such as the payment of interest on all sums due the contractor and not promptly settled.

The Board of Water Supply last week received permission from the Board of Estimate anad Apportionment to change the line of the Catskill Aqueduct from the Ashokan Reservoir to the Hudson River, and the application for the change will now be submitted to the State Board of Water Supply. The new line leaves the reservoir, near Esopus gorge, about five miles west of the previously chosen point, and then runs southward from five to eight miles west of the original line and crosses the Hudson River about eleven miles below the crossing previously selected. The most favorable site for the crossing is at Storm King Mt., where the river is not quite a mile wide, and where a deep rock tunnel can probably be driven. To prepare for the contingency, however, that further study may prove the crossing at this point to be impracticable, the Board has presented in its application an alternative line, differing only in the river crossing, which is at Denning Point under Newburgh Bay, where the river is about one and one-half miles wide, and should this route be selected the shield method or some system of sinking the tube in sections, or an equivalent method, would have to be used.

Indications are, however, that a satisfactory crossing can be made at Storm King Mt. The new route west of the river not only affords a better line, but shortens the Rondout Aqueduct, a feeder of the Catskill Aqueduct, about seven miles, and taps the Ashokan Reservoir at a more favorable point, where the water is much deeper than in the shallower eastern end of the reservoir.

A NEW CONCRETE MIXER.

About two years ago a continuous concrete mixer having a number of new features was devised, but its owners did not push it and eventually sold it to the Eureka Machine Co., of Indianapolis. This company submitted it to the most severe tests and made whatever improvements seemed desirable in the light of this experience. As now built it is a combination of two machines, one for measuring accurately the several materials for the concrete and the other for mixing them. In the "Eureka" machine, as the new mixer is called, the measuring device consists of a number of pocketed cylinders, which are rather clearly shown in the accompanying phantomized drawing. Above the cylinders for measuring the sand, gravel and crushed stone are rollers held in place by springs. These rollers serve to keep the pockets of the feeder just full of material, and at the same time provide sufficient flexibility so that rough, coarse material will pass through the machine without catching or giving any trouble. The so-called sand bin will handle material up to 2-in. screen, and the crushed stone bin up to 3-in. screen size.



THE EUREKA CONTINUOUS CONCRETE MIXER.

The mixing is done in a pug mill containing a large number of plow-shaped paddles, specially designed to handle coarse material without danger of catching and to stir the material effectively. The cement and sand or gravel are discharged together at the upper end of the mixing trough. They are mixed together first; then the coarse aggregate, crushed stone or large gravel, is added and thoroughly mixed in; then the material meets a spray of water, and after this the mass is thoroughly mixed before it is discharged from the machine, a hood on the discharge end being provided to take care of the output while changing wheelbarrows.

The output of the machine is limited principally by the ability of getting material to it, about 12 to 15 cu. yd. per hour being the maximum. The machine can be worked at this rate with a crew of five men, the makers state. This rate is on an absolutely continuous run of the machine, but in practice this cannot often be attained, as there are always interruptions of one kind or another in getting the material to or from the machine. At Schenectady, N. Y., recently thirty-nine large wagon loads of sand and gravel were put in the mixer in four hours.

The mixer is regularly equipped with 3½-h.p. air-cooled gasoline engine, or with steam engine and boiler, as wanted, or they can be furnished with water-cooled gasoline engines or electric motors. A simple jaw clutch on the slow speed shaft is used to stop and start the machine without having to stop the engine. This places the machine absolutely under the control of the operator all the time.

The factory of the company has been located at Jackson, Mich., but it is just completing at Lansing, Mich., a new factory, giving much better facilities.

WILLIAM FINDLAY SHUNK.

William Findlay Shunk, civil engineer, died at his home in Harrisburg, Pa., on Saturday, June 22. He was born at that city on Sept. 26, 1830, and was the son of Governor Francis Rawn Shunk and the grandson of Governor William Findlay, for whom he was named. He was educated at the old Harrisburg Academy and at Dickinson College, and then entered the navy as a midshipman in 1846. At the death of his father, Governor Shunk, he resigned from the navy and began his career as an engineer on the Pennsylvania R. R. He was for a time in the U. S. Coast Survey and in the government service during the war. During the early years of his professional work he was the chief engineer of the Dutchess & Columbia R. R., the Connecticut Western R. R. and the Lewisburg & Spruce Creek R. R.

He was an associate engineer on the construction of the present Pennsylvania elevated structure at the Broad St. Station Terminal in Philadelphia, and went from there to New York in 1877 to take charge of the design and construction of the Metropolitan Elevated R. R. His was the master mind in the planning of the 9th Ave. Elevated R. R. with the reversed curve on Phoenix columns. at 110th St., so long an object of wonder to the out-of-town visitors before the city was so built up as to shut the structure out of view. The Second Ave. Elevated R. R. was his design also.

At the opening of the elevated railroad in New York, the passengers were required to put their tickets in the chopping boxes *after* they had ridden. At that time two rates of fare existed, 10 cents for all except certain morning and evening rush hours, called commission

hours, when the fare was five cents. If a person got on a train during the commission hours and got off during the non-commission hours the ticket choppers required a 10-cent ticket. The result of this was riot, as people refused to pay the additional fare. Many people mislaid or lost their tickets in addition, and upon being refused permission to leave the stations until they had deposited tickets in the chopping boxes, they fought their way out. Mr. Shunk straightened this all out in a moment, by issuing orders requiring the dropping of the tickets in the boxes *before* the passengers entered the stations.

He left the Metropolitan Elevated R. R. in the spring of 1881, and in that summer made surveys for a railroad at Rockaway Beach and for a line from New York to Danbury, Conn., in possible opposition to the New Haven R. R. In the fall of 1881 he took up the South Penn R. R. survey, having in 1865 made preliminary surveys and partly selected a route for a road from Harrisburg to Pittsburgh. This work was put under construction and carried on until the late fall of 1885, when the project was abandoned as it stood. He was connected with the building of Washington Bridge across the Harlem River for a short time in the summer of 1886, and in the spring of 1887 he became chief engineer of the Kings County Elevated R. R. in Brooklyn, which kept him busy until the spring of 1889. During this time he was on a commission appointed by the Aqueduct Commission to examine and report on the Quaker Bridge site for a dam across the Croton River.

In 1890 he organized the expedition to South America under the Inter-Continental R. R. Commission, taking personal charge of the party which started from Guyaquil and worked north until Panama was reached. He found a feasible line with easy grades the whole length of that part of South America, and in years to come it will doubtless be followed when the time is ripe for the construction of a railroad in that country. This survey was practically completed in 1893, but a year or more was required in the preparation of the report of the Commission.

Following that work he returned to South America as chief engineer of Guayaquil & Quito R. R., as difficult and heart-breaking a railroad survey as was ever yet undertaken, especially when one considers that he had by this time passed his sixty-fifth year.

Upon his return from South America he retired to his garden spot, as he termed it, at Lucknow, near Harrisburg, and, save for a few years as engineer of the State Forestry Commission of Pennsylvania, gave up his professional work.

He was the first to recognize the need of a handy book of rules and tables for solving the field problems of railroad location, and in 1854 published such a work, which was rewritten and revised in 1879 under the title of the "Field Engineer," and is now in its 16th edition.

By nature he was one of the most kindly men, quick to help, ready to do one a good turn and untiring in his energy and love of work. His modesty and unassuming simplicity of manner occasionally gave an unobservant stranger the impression that he was not wide awake, but woe betide the man who, thinking thus, endeavored to do anything dishonorable in his dealings with him. His command of English was remarkable and his letters are treasures of language. Through his life he was possessed of the desire to do good, and his best epitaph can be taken from the preface to his own work, in which he says, "In dismissing the work from his hands, the precarious snatches of time occupied in its preparation, by day and by night, during the past two years, which might have been more agreeably spent in reading, talking or musing, recur to the writer's mind; and the thought arises, To what end or from what motive do people undertake these technical labors? Why should Forney and Bourne toil to simplify steam for our apprehension; Nystrom to compile mechanical, Molesworth and Trautwine to systematize civil engineering; Henck to prepare his elegant manual of field mathematics; Box to illustrate hydraulics; and Shreve, with lucid pen, to make clear for us the stresses in truss or arch? The ordinary [illegible] here have no place. There is neither fame nor profit in these drudging enterprises. At best the author gives name to his book; he remains impersonal—known but indirectly and but to a class. How then shall we account for his labors? I take it, the Father of mankind has not only made our minds to hunger for knowledge as our bodies for food, but has also imposed upon us a kindly law of communion, by virtue whereof we cannot do otherwise, without violence to generous nature, than share with our fellows whatsoever we have learned that seems new and useful. Under this law these beneficial works would appear to have had their being, and thus pure are they from the stain of selfishness.

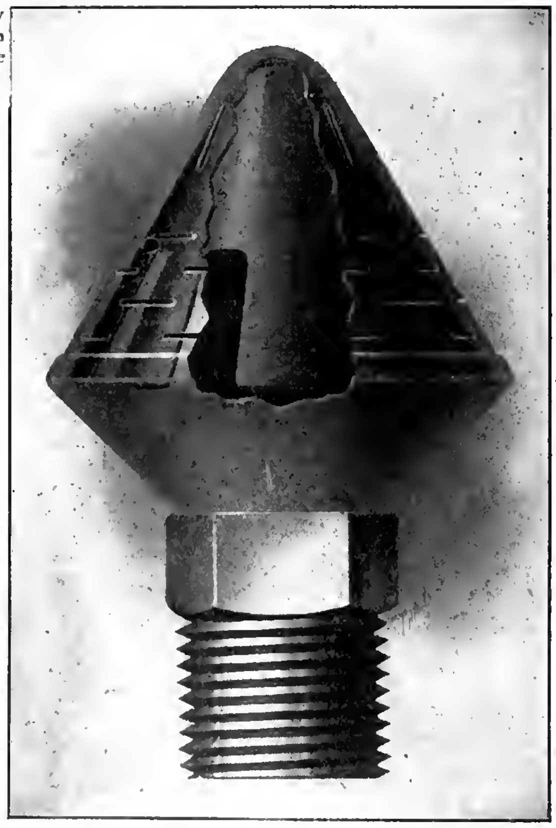
"Though the present writer would not arrogate equal fellowship in the eminent brotherhood named, yet he may justly claim like pureness from unworthy motive, and certainly feels like comfort at heart to that which they must know, for having discharged, in what measure it has been laid upon him, the divine obligation."

THE SCAIFE MECHANICAL FILTER STRAINERS.

About two years ago a new type of strainer for mechanical filters was put under test by the Wm. B. Scaife & Sons Co., of Pittsburg, and proved such a success that the company has adopted it for mechanical filters and also for the filters forming a part of the Scaife and the We-Fu-Go water softening and purifying apparatus. Suitable provisions for washing mechanical filters are essential for their satisfactory use, and a great deal of attention has been paid to them. For some years mechanically operated rakes were employed exclusively to break up the bed of filter sand and permit the impurities accumulating in it to flow away with the wash water, which was admitted below the bed. Subsequently compressed air was employed to agitate the sand, and lately it has been found that jets of water from the strainers, forced out of them in the opposite direction to that taken by the water during filtration, answered the requirements of most cases.

Of the many strainers that have been put on the market, the greater number have been circular disks of perforated metal, the perforations being either round or narrow rectangular slots. In the ordinary operation of the filter this type of strainer gives satisfactory results; that is, it prevents the sand from passing out with the filtered water, but when it becomes necessary to reverse the flow of water to wash the sand bed, a large quantity of water is required and little velocity is obtained on account of the size and number of the openings in the strainer. It is important in washing that the wash-water should have a high velocity. This, however, is hardly possible with the ordinary type of strainer, unless wash-water under a heavy pressure is used, because such a large number of them are required to get sufficient flow of the effluent from the low head in the filter. With the majority of strainers, the area of the openings is many times larger than the area of the supply line which carries the water for washing the filter. The small perforations in the strainers also cause a great deal of friction, and the area of these perforations must be much in excess of the actual area of the pipe outlet from the filter, in some cases as much as four or five times as great. This beng the case, a large quantity of water must be introduced to get an appreciable velocity, and even then it is often difficult to get a sufficient jet from each strainer to give a thorough washing.

DIRECTION OF JETS FROM NEW STRAINER.



CONSTRUCTION OF NEW SCAIFE STRAINER.

The Scaife strainer is a radical departure from those generally in use. It consists of an inner and outer cone, the inner cone being movable and of such shape that the openings in the outer cone are partially closed off when washing. The number of openings which are closed off can be adjusted in each particular case, so that the area discharging water into the filter-bed can be accurately adjusted to the size of the wash-out pipe.

The inner cone is held in place when washing by the pressure of the wash-water, as the stream entering the strainer strikes the closed portion of this cone, thus holding it firmly in place. This strainer has an ample area of openings to deliver the filtered water, but when washing, the inner cone reduces the area of the slots in the outer cone, so that the combined area of all the strainers is a little less than the area of the pipe through which the wash-water is introduced. In this way a uniform pressure can be maintained in each individual strainer, to give a high velocity of the wash-water through the openings of the strainer, which are arranged to give a radial discharge, thus insuring a thorough washing of every part of the sand-bed.

PERSONAL NOTES.

Mr. F. H. Cooke has been commissioned as a civil engineer in the United States Navy.

Mr. S. J. Merrill has been appointed master mechanic of the Union Pacific R. R. at Denver, Colo.

Mr. W. J. Black has been appointed assistant engineer of construction of the New York, New Haven & Hartford R. R., in charge of New Haven improvements.

At the fortieth annual commencement of the West Virginia University, Morgantown, W. Va., the establishment of a chair of mining engineering was announced.

The United States Civil Service Commission will hold an examination in the large cities of the country, July 17-18, of candidates for the position of aid in the coast and geodetic survey.

Lieut.-Col. Smith S. Leach, corps of engineers, U. S. A., has been relieved of his duties as a member of the general staff, and ordered to take up others in the office of the chief of engineers.

Mr. George Bradish has been appointed city engineer of La Crosse, Wis., succeeding Mr. Walter S. Woods, who resigned to become the engineer of the La Crosse Water Power Co., at Hatfield, Minn.

Mr. L. A. Downs, roadmaster of the Chicago division of the Illinois Central R. R., has been made assistant chief engineer of maintenance of way and has been succeeded as roadmaster by Mr. G. E. Boyd.

Mr. Calvin W. Hendrick, chief engineer of the Baltimore Sewerage Commission, has been granted an extended vacation so that he may study English sewage disposal plants. He will sail late in August.

Mr. J. A. Simmons, division engineer of the Natchez division of the Missouri Pacific Ry. system, at Vidalia, La., has resigned, and has been succeeded by Mr. J. A. Wright, road master on the Valley division.

Mr. W. H. Sellew has been promoted to the position of principal assistant engineer of the Michigan Central R. R., with offices at Detroit, and has been succeeded as division engineer by Mr. W. C. Cleveland.

Mr. George L. Watson has resigned the position of assistant chief engineer of the Fidelity Construction Co., Detroit, Mich., and has opened an office as consulting engineer in the Baxter Building, Philadelphia, Pa.

The office of assistant chief engineer of the Illinois Central and the Yazoo & Mississippi Valley roads has been abolished, and Mr. H. R. Safford, who held it, has been made chief engineer of maintenance of way of those lines.

Mr. Wallace Greenalch, superintendent and engineer of the Bureau of Water of Albany, N. Y., has succeeded Mr. Charles M. Bissel as commissioner of public works of Albany, Mr. Bissel having resigned to become fiscal supervisor of state charities.

The following are the members of the recently created New Jersey State Potable Water Commission: Foster M. Voorhees, Elizabeth; Richard Morrell, Passaic; Henry H. Humphries, Camden; George F. Wright, Paterson; J. H. Bacheller, Newark.

Mr. F. R. Coates, vice-president of the Wallace-Coates Engineering Co., Chicago, and formerly chief engineer of The Great Western Ry., is president and general manager of the San Pete Valley R. R. Co., recently organized at Salt Lake City, Utah.

Mr. Lewis B. Stillwell, New York City, recently received the honorary degrees of master of science and doctor of science from Lehigh University, S. Bethlehem, Pa., and Wesleyan University, Middletown, Conn., respectively. Mr. Stillwell took part of his undergraduate course at the latter university.

The recently organized Machinery Club of the City of New York has engaged quarters in the Fulton Terminal Building on Church St. The club will be primarily a lunching club, but it is expected that the unusual superiority of the appointments and the convenient location will make it a general rendezvous for the machinery trade in the city. The following officers have been elected: President, F. H. Stillman; vice-president, R. C. McKinney; treasurer, Walter L. Pierce; secretary, Theodore Waters.

Mr. P. Carroll has been appointed division engineer of the Missouri Pacific Ry. at Little Rock, Ark., and Mr. E. C. Welch to a similar place at De Soto, Mo. Mr. J. F. Peters has been transferred to the office of the principal assistant engineer at St. Louis.

Mr. H. B. Clement, formerly with Messrs. Carrere & Hastings, architects, New York City, has joined the architectural firm of Malcomson & Higginbotham, Detroit, Mich. The firm will be known hereafter as Malcomson, Higginbotham & Clement.

Mr. O. H. Gentner, Jr., of Philadelphia, has been engaged as assistant engineer in charge of estimating and drafting in the reinforced concrete department of the General Fireproofing Co., Youngstown, O. During the past nine years he has been connected with the design and construction of many reinforced concrete structures and has been associated, in Philadelphia, with Messrs. G. W. & W. D. Hewitt and Ballinger & Perrott, architects, and Mr. J. A. Patterson, consulting engineer, and in New York City with Messrs. Tucker & Vinton, the Unit Concrete Steel Frame Co. and the Vulcanite Paving Co.

Mr. Thomas Tait, chairman of the Victorian Railway Commission, reached this country June 29 on his return trip to Melbourne. Mr. Tait has made an extensive tour in Europe, where he has visited the important railways which have been changed from steam to electric power. The electrification of the Victorian steam railways and the cable system in Melbourne is under consideration by the railway commission, but the details of the system to be adopted have not yet been selected, as this will be left to the expert of the system, Mr. Charles H. Merz, of London, who has been engaged to make an exhaustive report on the subject.

The membership of the two New York State Commissions, created by the public utilities act, recently passed by the New York Legislature, has been announced as follows: For the First District (New York City), William R. Willcox, William McCarroll, Edward M. Bassett. Milo R. Maltbie, John E. Eustis; for the Second District (all other counties in the State): Frank W. Stevens, Thomas M. Osborne, Charles H. Keep, James E. Sague, Martin C. Decker. These commissions will take up the work formerly done by the State Railroad Commission, the Rapid Transit Commission, the State Gas and Electricity Commission and the State Inspectors of Gas Meters.

Mr. Charles D. McKelvey, of Paterson, N. J., has been appointed inspector of railroads of New Jersey by Mr. J. W. Congdon, president of the State Board of Railroad Commissioners. Mr. McKelvey began his railroad career in 1865 as a telegrapher and after serving on various roads as brakeman, conductor and train dispatcher he became in 1883 assistant superintendent of the New Jersey Midland R. R. Subsequently he was superintendent of the New York, Susquehanna & Western R. R., general manager of the Grand Central Station of the New York Central & Hudson River R. R., in New York City, general supreintendent of the New York, Susquehanna & Western R. R., and general superintendent of the Ohio Southern R. R.

CONTRACTING NEWS

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS, ENGINEERS AND MANUFACTURERS

ENGINEERING AND BUILDING SUPPLIES

WATER.

Notes Arranged Alphabetically by States.

Arkadelphia, Ark.—The question of constructing water works is reported under consideration here; probable cost, $30,000.

Pine Bluff, Ark.—See "Power Plants, Gas and Electricity."

**Los Angeles, Cal.*—Bids were opened on June 14 by the Bd. of Pub. Wks. for furnishing Portland cement for Los Angeles Aqueduct, a conduit 225 miles long to be built by the municipality from Owens Valley to Los Angeles for the purpose of furnishing city an adequate water supply. (*a*) 30,000 bbls. Portland cement, delivery to commence 60 days after execution of contract, to continue in such quantities and at such times as may be required, but not more than 5,000 bbls. in any one calendar month. (*b*) 1,250,000 bbls. Portland cement, exclusive of aforesaid 30,000 bbls., delivery to commence 12 mos. after execution of contract and to continue in such quantities and at such times as may be required, but not more than 30,000 bbls. in any one calendar month. (*c*) includes all Portland cement mentioned in items *a* and *b*. The award of contract for *a* (30,000 bbls) was let on June 18 to the California Portland Cement Co., of Colton, Cal. The freight from the factory of Mojave, the point of delivery, is 38 cts. per bbl. *b* and *c* have not been acted upon. For furnishing the large amount named in *b* and *c* the city is considering the advisability of building and operating its own cement plant. The following is the complete list of bids received (price given per bbl.): California Portland Cement Co., Colton, *a* $1.75 (awarded contract), *b* $1,325, Southern California Cement Co., Riverside, Cal., *a* $1.27½; Iola Portland Cement Co., Iola, Kan., *b* $1.60; Pacific Portland Cement Co., Cement, Cal., *b* $1.40; West Bldg. Material Co., Napa, Cal., or Davenport, Ia., *a* $1.20, *b* and *c* $1.05; Carl Leonardt, Cement, Cal., *a* $1.70, *b* $1.40.

Ukiah, Cal.—See "Power Plants, Gas and Electricity."

Denver, Colo.—The Denver Union Water Co. is reported to have decided to expend $700,000 in improving the water plant during the present year. David H. Moffat, Pres.

Manitou, Colo.—It is reported that the city will soon take steps to construct a reservoir on French Creek, to cost about $100,000.

Platteville, Colo.—It is reported that maps have been filed for the Wild Cat Reservoir, to be built in the vicinity of Platteville by Frank McCarthy, of Denver. The water of Platte River will be brought up over an area of 24 square miles by means of a dam 30ft. high. The capacity of the reservoir will be 500,000 cu. ft., and its supply will be drawn from South Platte River and tributaries above Big Thompson River. It is proposed to use the reservoir for direct irrigation for some 200,000 acres of land in eastern Weld County.

Pensacola, Fla.—It is stated that bids are wanted until July 9 for $225,000 water works, $100,000 sewer and $100,000 paving bonds.

Moscow, Idaho.—The City Council is reported to have on June 21 rejected all bids received for constructing water works, and the work will be done by the city. The city will also purchase all supplies and material for same.

Chicago, Ill.—Bids will be received until July 11 by the Bd. Local Improv. (H. S. Dietrichs, Pres.), for constructing water service pipes in portions of several streets.

Durand, Ind. Ter.—Water bonds to the amount of $35,000 are reported to have been issued for water works extension.

Lafayette, Ind.—See "Power Plants, Gas and Electricity."

Hartley, Ia.—The Town Council is reported to be considering the question of issuing $10,000 bonds for water works improvements.

Garnet, Kan.—Burns & McDonnell, 709 Dwight Bldg., Kansas City, Mo., is preparing plans and specifications for a filtration plant for Garnet.

Frankfort, Kan.—This city has voted to issue bonds for water works, and plans are now being prepared by Burns & McDonnell, 709 Dwight Bldg., Kansas City, Mo.

Homer, La.—The citizens are reported to have voted to construct water works.

De Quincy La.—See "Power Plants, Gas and Electricity."

Cumberland, Md.—The City Council is reported to be considering the question of constructing water works.

Paw Paw, Mich.—See "Power Plants, Gas and Electricity."

Houghton, Mich.—The City Council is reported to have authorized C. M. E. Craig, City Engr., to prepare plans for enlargement and development of the water system, to cost about $70,000.

**Henderson, Minn.*—W. D. Lovell, of Minneapolis, is reported to have received the contract for water works (bids opened June 14), for $9,580.

Kenyon, Minn.—W. C. Fraser, of Rochester, Minn., is reported to be preparing estimates of cost for a water tank and tower.

Jackson, Miss.—The citizens are reported to have voted on June 26 in favor of issuing $216,000 bonds for the purchase of the plant of the present water company.

Kansas City, Mo.—The Bd. of Pub. Wks. is stated to have decided to follow the recommendation of Geo. H. Benzenberg, Consulting Engr., Milwaukee, Wis., for water works improvements which include additional basins: new intake further up Missouri River at Quindaro; new centrifugal pump, 25,000,000 gal. daily capacity at Quindaro pumping station; another 20,000,000 gal. high pressure pump at Turkey Creek pumping station; a new 48-in. cast iron flowline from the Kaw tunnel to Turkey Creek station; the present lime mixing and solution tanks for clarifying of water to be duplicated, and additional capacity for storing fuel at Turkey Creek.

Billings, Mont.—The ranchers, living at mouth of Big Horn, have organized a ditch company and have had survey made to irrigate their lands; probable cost of canal and pump, $20,000. Henry Gerharz, of Billings, Engr. in charge.

Rondolph, Neb.—It is reported that bids are wanted until July 22 for laying about 5,000 ft. 4-in. and 1,500 ft. 6-in. c. i. water mains. C. S. Milliard, City Clk.

Tilden, Neb.—It is stated that bids will be received until July 11 (readvertisement) by F. L. Putney, Village Clk., for constructing water works. There will be required standpipe, concrete pump house, 2½ miles of pipe, etc. Iowa Eng. Co., Engrs., Clinton, Ia.

Oxford, Neb.—M. A. Earl & Co., of Muskogee, Ind. Ter., and Chicago, Ill., are preparing plans for water works for Oxford.

Elizabeth, N. J.—Bids will be received at the office of the Elizabeth Water Co., 68 N. Broad St., Elizabeth, until July 15, for laying about 3 miles of 36-in. water pipe, as advertised in The Engineering Record. John Kean, Pres.

Honeoye Falls, N. Y.—The Village Trus. are reported to be considering the question of constructing water works and a sewerage system.

New York, N. Y.—Bids will be received by John H. O'Brien, Comr. Water Supply, Gas and Electricity for furnishing, delivering and laying water mains in New Chambers, Water, Oliver, Henry anad Pike Sts. and in James Sl.

Bids will be received by the Bd. of Water Supply (Thos. Hassett, Secy., 279 Bway.) until Aug. 6 for the construction of the main dams for Ashokan reservoir near Brown Station in the towns of Olive and Marbletown, Ulster County, as advertised in The Engineering Record. J. Waldo Smith, Ch. Engr.

**Olean, N. Y.*—D. E. Barrows, Water Comr., writes that the contract for concrete lining for distributing reservoir at Cook's Hill, South Olean (bids opened July 1), has been awarded to Casey & Murray, of Rochester, for $31,080.

Buffalo, N. Y.—The Aldermanic Com. on Water is reported to have decided to report in favor of buying a site at Kensington, Grider and Colfax Sts. for the building of a water tower. The water tank will be 70 ft. high and hold about 500,000 gals. Bids for the work will be asked for soon.

**Carthage, N. Y.*—The following are reported to be the bids opened by the Bd. of Water Comrs. June 24 for the construction of water works: Field, Barker & Underwood, Philadelphia, Pa., $60,035; H. B. Failing, Baldwinsville, $58,842 (awarded contract); E. D. Bennett. Pulaski, $71,192; Burns, Haley & Burns, Watertown, $80,888.

Troy, N. Y.—Bids will be received until July 9 by Hiram W. Gordiner, Comp., for $76,000 additional water works bonds.

Wilson, N. C.—R. J. Grantham, of Wilson, is preparing plans for a filtration plant, to cost from $7,000 to $10,000. Bids for same will be received on July 15.

Maxton, N. C.—Preliminary surveys are now being made by J. M. Bundy, of Laurinburg, for water works and a sewerage system, to cost about $50,000. Report will be ready in about 3 weeks. Mr. Williams is Mayor.

Cleveland, O.—The lowest bid opened on June 28 for 1,400 tons 3 to 48-in. c. i. pipe was submitted by the U. S. Cast Iron Pipe & Fdy. Co., of Cleveland, for $50,000. The Semisteel Co., of Cleveland, was lowest bidder for special castings 3 to 48 in. for $8,692.

Sandusky, O.—Bids will be received by the Bd. of Pub. Service (Wm. Ohlemacher, Pres.) until Aug. 5 for the sale of a duplxe compound condensing Worthington pumping engine, with a capacity of raising 3,000,000 gal. of water in 24 hours 200 ft. above water in the pump well, as advertised in The Engineering Record. This pump was installed in 1876 and taken out in 1902.

The following are reported to be the bids opened on June 29 by the Bd. of Pub. Service for the filtration plant: Jackson Filter Mfg. Co., St. Louis, Mo., 6,000,000-gal. plant, with 1,000,000-gal. clearance or clear well storage, $75,000; with 500,000-gal clearance, $73,000. Thos. Lightbody, Youngstown, O., 6,000,000-gal. plant, complete, clear water well covered, $70,164; with tile roof instead of slate on building, $500 extra. Leonard-Martin Constr. Co., Chicago, Ill., plant complete, $70,000; with 1,000,000-gal. clear well storage, $77,000. Norwood Eng'g Co., Florence, Mass., six different plans, embodying use of different types and capacities of pumps, and varying arrangements: Plan 1, $87,357; plan 2, $88,357; plan 3, $85,482; plan 1½, $80,132; plan 4, add to cost of 1, 2 and 3, $9,500, this to provide a clear well capacity of 1,000,000 gals.; plan 5, decreasing capacity, take off $5,200 from plans 1, 2 and 3. Pittsburg Filter Mfg. Co., plant complete, $91,800; extras increase cost, if ordered. New York Continental Jewel Filtration Co., New York, N. Y., plant complete, $99,675.

Guthrie, Okla.—An election will probably soon be held to vote on issuing $30,000 bonds for filter plant and water mains; also for 6,000 ft. of storm sewer. W. W. Miller, City Engr.

Frederick, Okla.—The citizens are reported to have voted to issue $10,000 water extension and $25,000 sewer bonds.

Johnson City, Tenn.—The City Council has passed on first reading the ordinance authorizing the city to vote on issuing bonds for the purpose of buying its own water works.

Lehi, Utah.—The City Council is reported to be considering the question of constructing water works.

Burlington, Vt.—Bids will be received by the Filtration Com. (J. W. Goodell, Secy., 257 Pine St.) until July 22 for the construction of a mechanical filter plant complete, with all appurtenances, as advertised in The Engineering Record. Engineers, Hering & Fuller, 170 Bway., New York, N. Y.

**Items marked thus give the names of parties awarded contracts.*

Spokane, Wash.—Chas. McIntyre, City Engr., is reported to have recommended the sinking of wells near the pumping station as a new source of water supply; cost of proposed work about $25,000.

North Milwaukee, Wis.—Bids will be received until July 15 by Emil H. Klamp, Village Clk., for furnishing and laying about 1,200 ft. c. i. water pipes, setting stop gates, hydrants, etc.

Wausau, Wis.—The State Assembly has passed a bill granting the Wisconsin Valley & Improv. Co., of Wausau, a corporation composed of paper mill owners, a franchise to construct and maintain a large system of water reservoirs on tributaries of Wisconsin River north of the south line of Lincoln County.

**East Troy, Wis.*—Contracts for constructing water works (bids opened June 21) have been awarded as follows: Pipe and specials, U. S. Cast Iron Pipe & Fdy. Co.; hydrants, valves and valve boxes, Rensselaer Mfg. Co.; power house, Albert Ebert; pump, Gould Co., and 15-h.p. gasoline engine to Lacy and Clancy. Engineer, W. G. Kirchoffer, of Madison.

Bloomer, Wis.—Bids will be received by the Village Clk. until July 12 for the construction of a complete system of water works, consisting of steel tank, gasoline engine and deep well pump, small brick building and distribution pipe line system. Engineer, Oscar Claussen, of St. Paul, Minn.

Toronto, Ont.—C. H. Rust, City Engr., has submitted to the Bd. of Control, his report on the extension of the water system, which he estimates will cost abot $710,000. The work includes a new pumping engine with a daily capacity of 15,000,000 gals. to cost $250,000; new hydrants to cost $4,786; a 6,000 gal. pump at high level pumping station, $60,000; meters, $100,000, etc. Election to vote on issuing bonds for same will be submitted to ratepayers on Sept. 14.

North Battleford, Sask.—See "Power Plants, Gas and Electricity."

SEWERAGE AND SEWAGE DISPOSAL.

Notes Arranged Alphabetically by States.

Lamar, Colo.—Bids will be received by C. W. Heaton, Town Clk., until July 15 (readvertisement) for the construction of a sanitary sewer system, requiring 66,805 lin. ft. 8, 12, 15, 18 and 21-in. vit. sewer pipe, etc. Engineer's estimate, $77,000.

Hartford, Conn.—Bids will be received by the Bd. of Contract and Supply (Jas. P. Berry, Secy.), at Mayor's office, until July 8, for the construction of sewer in Asylum St.; estimated cost $15,000.

**Washington, D. C.*—The lowest and successful bid opened on June 17 by the Comrs. D. C. for constructing junction sewer at 10th and B Sts. N. W., was submitted by Warren T. Brenizer Co. at the following bid: 1,775 c. yds. Excav., $2.50; 20 c. yds. sewer brick masonry, $17; 35 c. yds. vitri. brick masonry, $26; 190 c. yds. concrete "B," $10.90; 275 c. yds. concrete "C," $10, and 175 lin. ft. 6-in. pipe underdrain, 30 cts; total cost, $10,561. The R. D. Beall Co. bid for this work $11,366.

*The lowest and successful bid opened on June 17 by the Comrs. D. C. for constructing junction sewer at 17th and B Sts. was submitted by Warren F. Brenizer Co. for $3,431.

The Cranford Paving Co. bid on June 18 for constructing sewers as follows: Sect. A—1,300 cu. yds. tunnel excav. in rock under canal, $6.40; 225 cu. yds. sewer brick masonry, $1,950; 40 cu. yds. vitrified brick masonry, $24; 170 cu. yds. concrete "B," $9.50; 220 cu. yds. concrete "D," $9.00; total, $17,262; Sect. B—1,800 cu. yds. excav., 95 cts.; 45 cu. yds. sewer brick masonry, $16.50; 90 cu. yds. vitrified brick masonry, $21; 1,025 cu. yds. concrete "B," $8.20; 200 cu. yds. rock excav., $1.90, and 1,000 cu. yds. embankment, 30 cts.; total, $13,427. D. E. McComb, Supt. of Sewers.

Bids were opened on June 20 for sewers, and the following are the lowest bids received on each division: E. G. Gummer, 612 F St., n. w., submitted lowest on Sewer A, Sewer B and Sewer C at $1,636, $2,383 and $2,163 respectively; Lyon Bros. was lowest on Sewer D, $1,312, and Jas. A. Coyle, lowest on Falls Branch sewer at $13,840.

Pensacola, Fla.—See "Water."

East St. Louis, Ill.—Chas. S. Lambert, City Clk., writes that the proposed sewerage system will cost about $750,000. W. J. Crocken, City Engr.; Silas Cook, Mayor.

Marshall, Ill.—H. O. Weldon, City Clk., writes that the proposed sewerage system will cost about $20,000, but nothing definite will probably be done before fall. Engineer, C. A. Purdun, of Marshall.

Chicago, Ill.—Bids will be received until July 11 by the Bd. Local Improv. (H. S. Dietrichs, Pres.), for constructing a system of brick and vitrified tile pipe sewers in portions of several streets.

*The contract for constructing sewer in State St., between 30th and 55th Sts., is reported to have been awarded to McCarthy & Cleary for $228,000.

**Pana, Ill.*—The contract for constructing the west end sewerage system is reported to have been awarded to John Ham, of Litchfield, for $20,479.

East St. Louis, Ill.—At a public meeting held here recently, it is reported, that plans for the proposed outlet sewer were approved, they will cost about $744,000. W. J. Crocken, City Engr.

**Elkhart, Ind.*—The Bd. of Pub. Wks. is reported to have on June 19 awarded to the Northern Constr. Co., of Elkhart, the contract for constructing sewer in Dist. 10 for $62,370. C. Defrees, of South Bend, bid for this work $68,375.

Indianapolis, Ind.—A sewer 6 miles long, draining the territory between Rural St. and Emerson Ave., and Michigan and 16th Sts., and connecting with the E. Michigan St. sewer, is being planned by Blaine H. Miller, City Engr. It will cost about $200,000.

Evansville, Ind.—W. J. Dunn, City Clk., writes that it is proposed to construct a brick and concrete sewer on Kentucky Ave. Jas. D. Saunders is Engr. and W. F. Wunderlich is Clk. Bd. of Pub. Wks.

Cedar Falls, Ia.—Bids will be received until July 11 by the City Council for furnishing material and constructing sewers in portions of Bluff, 12th, Normal and Main Sts., requiring about 2,957 lin. ft. 8-in. and 130 ft. 6-in. sewer pipe, 11 manholes, etc. W. H. Merner, Mayor.

**Waterloo, Ia.*—Local press reports state that the contract for the construction of about 5 miles of sewers (bids opened June 17) has been awarded to W. N. Dearborn, of Cedar Rapids, at the following bid: 1,590 ft. 48-in. concrete, $6.50; 14,045 ft. 36-in. concrete, $4; 340 ft. 33-in. pipe, $4.50; 4,970 ft. 30-in. pipe, $3.60; 900 ft. 24-in. pipe, $2.30; 340 ft. 18-in. pipe, $1.60; 1,310 ft. 15-in. pipe, $1.15; 1,320 ft. 12-in. pipe, 85 cts.; 58 manholes, each, $30; 2 bulkheads, each, $150; total cost, $93,219. The other bids received were: W. N. Dearborn, Cedar Rapids, $93,219; M. Ford, Cedar Rapids, $101,940; People's Constr. Co., Davenport, $108,942, and Independent Constr. Co., Davenport, $111,493.

Eureka, Kan.—Bids will be received until July 31 by J. H. Smythe, City Clk., for furnishing material and constructing 1,143 ft. 8-in. sewers. C. C. Huntington, City Engr.

New Orleans, La.—Bids will be received by the Sewerage and Water Bd. (F. S. Shield, Secy.) until Sept. 11 for the furnishing and laying of approximately 110 miles of sewers, from 8 to 27 in. and 5 to 17 ft. deep, to include about 1,230 manholes and 443 flush tanks, as advertised in The Engineering Record. The work will be divided into 4 contracts. Geo. G. Earl, Gen. Supt.

Baltimore, Md.—Bids will be received until July 10 by the Bd. Awards (J. Barry Mahool, Pres.), for sinking a test well on the site of the proposed sewage pumping station, to be 12 ft. sq. on top outside sheeting, and to be carried to a depth of 30 ft. below the surface of the ground.

**Taunton, Mass.*—The Sewer Com. is reported to have awarded contract for extension of sewer main on W. Water St. to the Geo. M. Bryne Co., of Boston, for $15,257.

Muskegon, Mich.—C. S. Gamble, City Engr., writes that contracts will probably soon be let for sewer No. 8 which will require about 3 miles of sewers, 24 to 8 in.

Lansing, Mich.—H. A. Collar, City Engr., writes that bids will be received on July 15 by the City Clerk for sewers in Park Pl. addition to consist of 6,320 ft. of 8, 10, 15, 18, 20 and 24-in. pipe; estimated cost, $18,099.

Iron River, Mich.—Bids will be received by Chas. A. Otto, Village Clk., until July 17 for the construction of the sewers in Main Sewer Dist. No. 1 as advertised in The Engineering Record. Engineers, E. G. Bradbury and G. P. Shute, 85 N. High St., Columbus, O.

Sedalia, Mo.—The City Council on June 19 passed ordinances providing for the construction of sewers in Sub Districts A, B and C of sewer Dist. 22.

Holdredge, Neb.—M. A. Earl & Co., of Muskagee, Ind. Ter., and Chicago, Ill., are making surveys for a sewerage system for Holdredge.

Plainfield, N. J.—Andrew J. Gavett, City Surveyor, writes that the lowest bid opened on June 20 for constructing storm sewers was submitted by C. M. Meeker, of Plainfield, as follows: 990 ft. 36x29-in. concrete sewer, 5 to 6 ft. cut, $3.25; 5 manholes, ea., $45; 20 branches, 12-in., ea., $2; and 1,553 ft. 33-in. circular pipe, concrete or cement block sewer, 6 to 7 ft. cut, $3.50.

West Orange, N. J.—Sewer bonds to the amount of $142,000 are reported sold.

Silver City, N. M.—C. C. Whiteball is reported to have secured a franchise for a sewerage system.

**Items marked thus give the names of parties awarded contracts.*

send block, F. A. Brutsch & Son, 826 Clinton Ave. S., $29,095.

New York, N. Y.—Bids were opened on June 20 by Louis F. Haffen, Pres. Bronx Boro., for paving as follows:

Clay Ave. from E. 166th St. to 167th St. and from 168th St. to Wendover Ave.: (a) 18,330 sq. yds. iron slag pavt.; (b), 2,700 cu. yds. concrete; (c), 8,250 lin. ft. old curb; (d), totals: Atlanta Contr. Co., *a*, $3.49; *b*, $4.74; *c*, 30 cts.; *d*, $79,529; Sicilian Asphalt Paving Co., *a*, $3.25; *b*, $5.10; *c*, 40 cts.; *d*, $73,948.50; Asphalt Constr. Co., *a*, $3.09; *b*, $5; *c*, 35 cts.; *d*, $73,327.

Prospect Ave. from Tremont Ave. to E. 189th St. Lowest bidder, Continental Asphalt Paving Co., 16,348 sq. yds. asphalt block, $1.89; 2,570 cu. yds. concrete, $4.48; 8,900 lin. ft. old curb, 34 cts.; total, $45,437. Totals of other bids: Barber Asphalt Paving Co., $45,792, and Hastings Pavt. Co., $46,839.

Trinity Av., from Westchester Ave. to E. 161st St. Lowest bidder, Barber Asphalt Paving Co., 8,918 sq. yds. asphalt blocks, $159½; 1,360 cu. yds concrete, $5.50; 4,200 lin. ft. old curb, 42 cts.; total, $23,468. Continental Asphalt Paving Co., $24,149; Asphalt Constr. Co., $25,335, and Hastings Pavt. Co., $24,622.

Creston Ave. from Burnside Ave. to E. 184th St.: Lowest bidder, Barber Asphalt Paving Co., 9,540 sq. yds. asphalt blocks, $1.60; 1,520 cu. yds. concrete, $5.50, 5,550 lin. ft. old curb, 37 cts.; total, $25,677. Totals of other bids: Continental Asphalt Paving Co., $26,086; Hastings Pavt. Co., $27,286.

The Barber Asphalt Co. submitted the lowest bid on paving other streets in Bronx Boro. with asphalt (bids opened June 20), as follows: Park Ave. E. from E. 183rd St. to Pelham Ave., $15,023; E. 170th St. from Franklin Ave. to Boston Rd., $6,507; Beekman Ave. from E. 141st St. to St. Mary's Park, $6,115, and E. 185th St. from Park to 3rd Ave., $6,423.

Bids will be received until July 16 by Louis F. Haffen, Pres. Boro Bronx, for constructing the Transverse Rd. at E. 204th St., and at Burnside Ave. in connection with the Grand Boule. and Concourse. Engineer's estimates: 15,755 cu. yds. earth excav., 3,100 cu. yds. rock excav., 40,750 cu. yds. filling and back-filling, 4,600 cu. yds. dry rubble masonry, 4,100 cu. yds. cyclopean masonry, 1,000 cu. yds. Class "A" and 10,450 cu. yds. Class "B" concrete, 19,000 sq. ft. waterproofing, 540 cu. ft. granite newels, fenders and coping, 970 lin. ft. 18-in., 1,375 lin. ft. 12-in. and 440 lin. ft. 10-in. vitri. stoneware pipe drain, 126 spurs for house connections, 24 manholes, 4,200 sq. yds. paved gutters, 745,000 lbs. steel and iron (exclusive of railings), 3,550 sq. ft. woven wire fabric, 6,350 lin. ft. new bluestone curb, 39,350 sq. ft. cement and 1,750 sq. ft. bluestone flagging, 3,600 sq. ft. new bridgestone, 9,000 sq. yds. asphalt blk., 8,050 sq. yds. iron slag and 1,500 sq. yds. macadam pavt., 183 lin. ft. Type "A," 2,345 lin. ft. Type "B" and 1,750 lin. ft. Type "C" railing, etc.; also regulating curbing and flagging the sidewalks, etc., on 193d St., Shakespeare and Nereid Aves., and building approaches, etc., on Manida St., paving with granite block Devoe Ave. Engineer's estimate: 2,550 sq. yds. new granite blk. pavt., on a sand foundation, laid with sand joints, and keeping the pavt. in repair for yr. from date of acceptance, 73,400 cu. yds. earth and 4,050 cu. yds. rock excav., 18,030 cu. yds. filling, 6,785 lin. ft. new curb, furnished and set, 26,250 sq. ft. new flagging, furnished and laid, 4,425 sq. ft. new bridgestone for crosswalks, furnished and laid, 1,000 lbs. c. i. inlet frames and covers, in place; also same time and place for furnishing and delivering to the Bureau Highways 15,000 cu. yds. best quality 1½-in. and 5,000 cu. yds. ½-in. broken stone, tran rock, lime or native stone; also furnishing and delivering to the Bureau Highways a double cylinder steam road rollers, Buffalo-Pitts or equal (size, 15 gross tons).

**Elmira, N. Y.*—S. A. Warner, City Clk., writes that Costello & Neagle, of Elmira, have secured the contract for paving E. Church St., about 7,800 sq. yds. (bids opened June 24).

Kenmore, N. Y.—The citizens are stated to have voted to issue $60,000 bonds for street improvements.

Brooklyn, N. Y.—The Hasting Pavt. Co., 25 Broad St., N. Y. City, submitted the following bids, which were opened by the Park Bd. of N. Y. City on June 20: For furnishing all labor and materials necessary for repairing walks in Prospect Park, with asphalt tiles together with all work incidental therto, 140,000 sq. ft., 26 cts. per sq. ft.; total, $36,400, and 68,000 sq. ft. asphalt tiles on sand foudation, and 3,000 cu. yds. excav. in Sunset Park for $19,220.

Bids will be received until July 17 by Bird S. Coler, Boro. Pres., for regulating and repairing with asphalt on 58th, Halsey, Macon and Ross Sts., Hampton Pl. and Throop Ave., also regulating, grading, curbing and laying sidewalks on several streets, including Coney Island Ave., Schenck Ave. and 71st St. Engineer's estimate includes 97,560 sq. ft. cement sidewalks, 33,200 lin. ft. new curb, 14,900 sq. yds. asphalt, 1,910 sq. yds. asphalt block, 12,930 cu. yds. earth excav., etc.
Parks (Moses Herrman, Pres.), New York City, for fur-
Bids will be received until July 18 by the Comrs. of nishing material and constructing asphalt tile walks in Bedford, Bushwick, Fulton, Saratoga and Irving Sq. Parks, Boro Brooklyn.

The Bd. of Aldermen on June 25 voted to grant Bird S. Coler, Boro. Pres., $100,000 with which to repair asphalt pavements.

*Bids were opened on June 28 by Bird S. Coler, Pres. Brooklyn Boro for paving as follows:

Regulating and paving with asphalt on a concrete foundation 11th Ave. from 15th to 18th Sts. Successful bidder, Brooklyn Alcatraz Asphalt Co., 407 Hamilton Ave., Brooklyn, at $1.18 per sq. yd. for 6,820 sq. yds. asphalt pavt., and $5.75 per cu. yd. for 960 cu. yds. concrete; total, $13,568. Totals of other bids: Barber Asphalt Paving Co., 114 Liberty St., N. Y. City, $14,298; Uvalde Asphalt Paving Co., 1 Bway., N. Y. City, $14,032, and Cranford Co., 52 9th St., Brooklyn, $14,313.

*Regulating and paving with asphalt on concrete foundation Foster Ave., from Flatbush Ave. to E. 17th St., and from E. 14th St. to Coney Island Ave. Successful bidder, Cranford Co., 52 9th St., Brooklyn, as follows: 15,930 sq. yds. asphalt, $1.24; 2,250 cu. yds. concrete, $5.85; total, $32,913. Totals of other bids: Barber Asphalt Paving Co., $33,918, and Uvalde Asphalt Paving Co., $33,412.

*Regulating, grading, curbing and laying sidewalks on Grand St., as extended from Hooper St. to Bridge Plaza. Successful bidder, Matthew T. Meagher, 1127 Willoughby Ave., Brooklyn, as follows: 3,562 lin. ft. new curb set in concrete, $1; 50 lin. ft. old curbstone reset, 50 cts.; 8,000 cu. yds. earth excav., 69 cts.; 59,340 sq. ft. cement sidewalk, 15 cts.; total, $18,862. Totals of other bids: Chas. Cranford, 44 Court St., Brooklyn, N. Y., $20,893; John Monahan, Pilling St., Brooklyn, $19,145; Bracken M'Avency Co., ft. 6th St., Brooklyn, $20,401; O'Grady Bros., 72 N. 8th St., Brooklyn, $19,972, and Builders' Truck and Material Co., Troy Ave., Brooklyn, $18,862.

Columbus Barracks, O.—Bids for construction brick road pavement, concrete sidewalks, gutters, etc., at this post will be received by H. B. Chamberlin, Constr. Q. M., U. S. A., until July 19.

Cincinnati, O.—It is stated that bids will be received until July 10 by the Bd. Pub. Service (M. J. Keefe, Clk.), for grading, paving and curbing a portion of Grandin Road, estimated to cost $21,988; also until July 15 for grading and paving Beechmont Ave., estimated to cost $99,790. Chas. N. Dannenhower, City Engr.

*The County Comrs. on June 25 are stated to have awarded the contract for improvement of Colerain Pike to N. Ruehel at $49,905.

Bids will be received until July 26 by the Bd. Co. Comrs. (Fred Dreilis, Clk.), for improving Harrison Pike, Harrison, O.; Whitewater, Colrain and Harrison Townships, as per specification 651; also Hamilton Pike, Mt. Healthy Springfield Township, as per specification 61.

*The Bd. of Pub. Service on June 20 is reported to have awarded contracts for the wood block paving as follows: United States Wood Preserving Co., 29 Bway., New York, N. Y., Albany Ave., $39,544; Cross Lane, $5,725; McMillan St., to Kirchner Constr. Co., cor. 8th and Plume Sts., $30,645.

Bids will be received until July 19 by the Bd. Co. Comrs. (Fred Dreihs, Clk.) for improving Lisk Run Pike, Green Township as per specification No. 638; also, until July 29 for improving Colerain Pike, Colerain Township, as per specification No. 621.

Findlay, O.—It is stated that bids will be received until July 20 by the Co. Comrs. for constructing 3 miles of stone pipe in Orange Township.

Painesville, O.—State Highway Comr. Sam'l Huston, Columbus, O., is asking for bids for a highway proposed under the new Ohio law, to be let at Painesville on July 23rd.

Cleveland, O.—Bids will be received until July 27 by the Bd. Co. Comrs. (Julius C. Dorn, Clk.), for repairing the pavement on Bentleyville Rd., Chagrin Falls Township; also repairing the pavement on Berea Rd. A. B. Lea, Co. Engr.

Columbus, O.—E. F. McGuire, Secy. Bd. Pub. Service, writes that bids will be rceived on July 12 for constructing an asphalt repair plant.

**Marion, O.*—The Bd. of Pub. Service is reported to have awarded the contract for constructing stone sidewalks on Mound and John Sts., Cummin, Cleveland and Wilson Aves., to H. W. Mann at 16 cts. and 15½ cts. per sq. ft.

**Newport, O.*—The Bd. of Aldermen is stated to have awarded contracts for repaving with brick as follows: 11th St. to Collopy & Co., at $23,016; 3d, 5th, 7th, 10th Sts., to R. L. Schoolfield, at $3,957, $3,465, $3,270 and $4,306, respectively; Hamlet and 8th Sts., to E. J. Knoepfle, at $2,307 and $4,180, respectively.

Archbold, O.—It is stated that bids will be received by O. W. Hill, Village Clk., until July 15 for paving Depot St.

Monroeville, O.—The following bids are reported opened June 17 for paving with brick Main St.: Kellogg & Blume, of Norwalk, $4,026; Stowers & Jones, of Monroeville, $4,209; Lee & Griggs, of Clyde, $3,623.

Elyria, O.—It is stated that bids will be received by the Bd. Co. Comrs. until July 12 for grading, draining and macadamizing sundry roads. L. A. Fauver, Co. Surv.

El Reno, Okla.—L. G. Adams, City Clk., writes that it is proposed to pave with brick certain streets. Engineer, R. N. Whittlesey, of El Reno.

**Portland, Ore.*—The Pacific Bridge Co., Mohawk Bldg., is reported to have secured the contract for paving E. Taylor St. for $16,769.

Bridgeton, Pa.—The Borough Council is reported to have passed an ordinance providing for the paving of numerous streets at an estimated cost of $75,000.

Wilkesbarre, Pa.—Bids will be received at the office of Jas. M. Norris, County Controller, until July 18 for paving with vitrified paving block on Broad St., in Hazle Township; also, same time and place, for furnishing and delivering the vitrified paving block for paving Broad St. in Hazle Township, both proposals advertised in The Engineering Record.

*The contract for paving Curtis St. with Mack brick is reported to have been awarded to Fitzpatrick & McConville at $1.57 per sq. yd.

Harrisburg, Pa.—It is stated that contracts will soon be let for 27,945 sq. yds. paving, including improvement of Hummel, Dauphin, Elm and 17 Sts.

**Manor, Pa.*—The City Council is reported to have awarded the contract for paving throughout Manor to Hastings & Barrett, of Charleroi, at $1.30 per sq. yd.

E. Howley, Bijou Bldg., at $17,262 and $21,080 respectively.

Houston, Tex.—Bids for paving 70,865 sq. yds. with brick and excavating 13,270 cu. yds, is reported to have been opened June 17 by City Council. The city to furnish the brick. Kelso & Vantian, $80,911; W. S. Hipp, $75,151; Municipal Paving Co., $75,410; A. T. Lucas, $60,950.

Bids will be received until July 12 by John B. Ashe, Co. Aud., for paving Houston and Crosby Rds.

Ogden, Utah.—The following work has been fully determined on to be done in this city. Bids will be called for on each job separately and at different times: Washington Ave. sidewalks, over 24 blocks; Orchard Ave. sidewalks, 1 block; Orchard Ave. curb and gutter, 1 block; 27th St. curb and gutter, 7 blocks; Wall Ave. curb and gutter, 2 blocks; Wall Ave., asphaltum pavt., 1 block; Monroe Ave. sewer, 1 block. Each block comprises 660 ft. A. H. Parker, City Engr.

**Seattle, Wash.*—The Bd. of Pub. Wks. is stated to have awarded contracts as follows: Regrading Westlake Ave., to Hans Pederson, $16,379; to Oltosen & Jenson for $39,710.

Centralia, Wash.—It is sated that bids are being received for paving with bitulithic Tower Ave., at a cost of about $45,000.

**Bluefield, W. Va.*—Kelley Bros., of Portsmouth, O., has secured the contract for paving 8 streets with vitr. brick on concrete foundation, about 48,000 sq. yds.; amount of contract estimated at $107,000.

La Crosse, Wis.—The County Bd. is stated to have decided to construct a highway between West Salem and Mindoro, to cost about $7,000.

Fond du Lac, Wis.—The paving of streets as follows is reported contemplated: 3d St. with brick, W. 2d St., tar macadam, and Park Ave. with asphalt.

Milwaukee, Wis.—Bids will be received until July 9 by the Bd. Pub. Wks. (Chas. J. Poetsch, Chmn.) for resurfacing with asphalt on the present concrete foundation, a portion of Jefferson St.

Neenah, Wis.—Bids will be received until July 13 by the Bd. Pub. Wks. (Robt. Jameson, Chmn.), for furnishing material and constructing a vitrified block pavement on N. Commercial St.

North Battleford, Sask.—Bids will be received until Aug. 7 by S. Cookson, Secy.-Treas., for $7,000 street grading and sidewalk bonds.

POWER PLANTS, GAS AND ELECTRICITY.

Notes Arranged Alphabetically by States.

Greensboro, Ala.—The Greensboro Water & Light Co. is planning to establish an all-night service and install meters. Jas. E. Webb, Jr., is mgr.

Uniontown, Ala.—This city is contemplating installing meters in the next fiscal year, and will also install larger hydraulic pumps. S. T. Townsend, Supt. Water and Light Plant.

Pine Bluff, Ark.—The Pine Bluff Water & Light Co. is reported to have decided to build new water works and electric light plant on W. 4th Ave.

San Francisco, Cal.—The following are the bids opened on June 14 by Capt. B. F. Cheatham, Q. M., U. S. A., for installing electric lighting system, etc., at Forts Barry and Baker: *a*, wiring buildings; *b*, furnishing fixtures; *c*, construction primary and secondary device; *d*, furnishing transformers, arc light, etc.; *e*, construction sub station; *f*, construction pumping plant; *g*, furnishing current; H. S. Tittle, 229 Minna St., *a*, $1,230; *b*, $4,048; *c*, $20,405; *d*, $6,550; *e*, $4,870; *f*, $9,240; A. C. Mattingly, 300 Polk St., *a*, $1,855; *b*, $5,500; *c*, $15,475; *d*, $7,370; *e*, $4,400; *f*, $7,100. Levy Elec. Co., 1005 Post St., *a*, $3,200, King Constr. Co., 1333 Eddy St., *e*, $2,800; C. S. Rankin, 724 Gough St., *e*, $5,441, and Bay Counties Power Co., 925 Franklin St., *g*, 3 cts. per kw.

Ukiah, Cal.—It is stated that bids will be received until July 13 by the Bd. Trus. at Ukiah for purchase of a franchise of the Snow Mountain Water & Power Co. to erect and maintain transmission line in the town of Potter Valley.

Denver, Colo.—The Central Colorado Power Co. is reported to have filed a mortgage of $20,000,000 in the Clerks' offices of Larimer, Grand, Summit, Lake, Eagle, Pitkin, Garfield and Denver Counties. The company will have three plants, which will have a combined capacity of 125,000 h.p. The property covered includes the De Remer water power location at Shoshone falls above Glenwood Springs, where work is already under way, about 25,000 h.p.; also the Gore canon plant; and the third power plant will be located on Roaring Fork near Aspen. In addition the company will have 6 storage reservoirs, 2 on upper Roaring Fork and 4 on Grand River. The mortgage is reported to have been filed by Lunt, Brooks & Wilcox, of Colorado Springs, Mgrs. of the company.

Winsted, Conn.—The Winsted Gas Co. is contemplating increasing its power plant and will install two 100-kw. Curtis steam turbines and 250 h.-p. boilers, and will also change the system to 60 cycles. Henry Skinner, Mgr.

Washington, D. C.—See "'Miscellaneous.'

Kilbourne, Ill.—E. H. Parker is reported to have decided to establish an electric light plant.

Bloomington, Ill.—Bids will be received until July 9 by Harry E. Rhoads, City Clk., for reconstrucing electric light plant. There will be required one 350-kw. generator, 400 Series A. C. arc lamps, drawing 6.6 amperes, with regulators and transformers; one surface condenser, with air and circulation pumps, capacity 12,000 lbs. steam per hour, etc.; also one smaller direct-connected unit, consisting of simple automatic engine and 60-kw. generator. A. T. Malthy, Consulting Engr., 803 Great Northern Bldg., Chicago. Probable cost, $40,000.

Beardstown, Ill.—The Beardstown Electric Light & Power Co. is contemplating building a coal gas plant this year with 6 miles of main and a 50,000 cu. ft. gas holder, two benches of "sixes" retorts. W. E. McCollough is mgr.

Cornell, Ill.—M. J. Rhodes, owner and mgr. of the Cornell Electric Light Plant, is now erecting a new building, and contemplates changing the system from 125 to 60 cycles, and also to install an exhaust steam heating system this season.

Winchester, Ind.—The Citizens' Water & Light Co. proposes changing its D. C. to A. C. and will need 1,500 incandescent lamps, 2 500-light transformers and 1 300-light transformer.

Corydon, Ind.—The Corydon Light, Water & Ice Co. contemplates equipping its plant with a new engine and dynamo this fall.

**Items marked thus give the names of parties awarded contracts.*

Kokomo, Ind.—The Kokomo, Marion & Western Traction Co. (consolidated with Kokomo Ry. & Light Co.) proposes installing a new 1,000-kw. turbo alternator.

**Lafayette, Ind.*—The Lane-Pike Co., of Lafayette, is reported to have secured the contract for an electric light plant at the Indiana State Soldiers' Home, for about $10,000. The Lafayette Eng. Co., of Lafayette, secured the contract for a water tank for the Home at about $3,000.

Ft. Wayne, Ind.—Bids were opened on June 24 by the Bd. of Pub. Wks. (Edw. J. Lennon, Chmn.) for the construction of a municipal electric light and power plant, and the following are reported to be the bids received (Engineer, Owen Ford, of St. Louis, Mo.): Moellering Constr. Co., Ft. Wayne, for constructing dam across Spy Run Creek, $1,238; B. Borkenstein, Ft. Wayne, power station and coal storage complete, $17,500; dam across Spy Run, $1,576; W. Nassenstein, Ft. Wayne, power plant and coal storage, $21,281; H. Hilgemann & Bro., Ft. Wayne, power plant and coal storage, $19,900; Alphons Custodus Chimney Co., Chicago, Ill., stack 160 ft. high, $4,844; Heine Chimney Co., Chicago, stack 160 ft. high, $4,822; stack 120 ft. high, $2,500; Weber Steel Concrete Co., Chicago, Ill., stack 160 ft. high, $3,400; stack 120 ft. high, $2,250; Atlas Constr. Co., St. Louis, Mo., stack 160 ft. high, $3,630; Adams-Bagnall Co., Cleveland, O., 430 arc lamps for $88,770, or $20.40 each; cut-outs, $1,548; F. Bissell Co., Toledo, O., pole line and wiring system and underground work, $23,100; Ryan Constr. Co., Indianapolis, transformers, $4.50; No. 6 wire, $28 per mile; No. 8 wire, $26.50 per mile; poles ranging from $3.75 to $5; Ricard Boiler & Engine Co., Toledo, boilers, equipment and stack connections submitted in 3 plans, respectively, $10,528, $14,328 and $14,878; Oldberger Condenser Co., New York, N. Y., No. 2 condenser and equipment, $6,491; No. 3, $9,567; O. K. Eng'g Co., St. Louis, boilers and equipment and stack connections, $12,535, and $872 for breeching; International Gas Power Co., St. Louis, Mo., producer gas power plant, gas engines, steam engine reserve, direct-connected generators and exciters, $79,100; S. M. Jones Co., Toledo, producer gas power plant, etc., without dynamos, $53,000; Thompson Sons Mfg. Co., Beloit, Wis., gas power plant, gas engines, complete with producers, $63,376; American-Diesel Eng. Co., New York, N. Y., producer gas plant, etc., with two oil engines, including tanks, $81,100; Western Electric Co., Chicago, Ill., 4 bids for producing plant, including generators and exciters, aggregating $55,876; Westinghouse Electrical Co., Pittsburg, Pa., are lamps, transformers, switchboard, appliances and station electrical work, $21,195; including metal flare lamp, $28,085; Westinghouse Machine Co., St. Louis, Mo., steam turbine generators and exciters, $41,543; McWilliams & Co., Louisville, Ky., complete plant, buildings, and equipment and distributing system, $200,000; also a divided bid providing combinations of certain sections and omitting others, so the three bids are $96,000, $123,000 and $174,000, but each of these omits certain parts of the total; Ft. Wayne Electric Wks., Ft. Wayne, bid on several portions of work as follows: For arc light transformers, switchboard appliances, station equipment and arc lamps, $24,868; are lamps, $17,316 and $17,846; for direct-current system, $30,497.60, and with luminous arc light system, $32,049; steam turbine generators and exciters, $48,150; feed water heater, boiler feed pumps, separators, pipe work and connections, $44,480; for complete pole line and wiring system and underground work, $31,900; Electrical Steam & Eng. Wks., St. Louis, Mo., 3 bids on complete plants without boilers, engines, omitting also turbine generators and gas plant; there were separate provisions as to different sections and the figures were $79,900 to $83,394; McBride Electrical Co., St. Paul, Minn., feed water boiler, pumps, separators, arc lamp transformers, station electrical work, etc., arc lamps, pole line and wiring system, etc., transformers and connecting public buildings and power station and storage, $84,835; C. L. Olds Constr. Co., Ft. Wayne, pole line and wiring and underground work, transformers and connecting public buildings, from $45,137 to $49,391; Sterling Consolidated Boiler Co., Chicago, Ill., two boiler propositions, $14,592 and $15,025, with $2,680 extra for superheaters.

*We are informed that contracts for the above municipal plant were awarded as follows on June 26: To Ft. Wayne Electric Works, Ft. Wayne, for Sec. 3—Steam turbine generators and exciters; Sec. 4—Condenser equipment; Sec. 7—Arc lamp transformers, switchboard, appliances and station electrical work; Sec. 8—Arc lamps, and Sec. 10—Transformers and connecting public buildings, for a total of $73,899. To McBride Electric Co., of St. Paul, Minn., for Sec. 9—Pole line and wiring system and underground work (distributing system, and Sec. 11—Power plant and coal storage, for a total of $56,002. To O. K. Eng. Co., of St. Louis, Mo., Sec. 1—Boilers and equipments and stack connections, and Sec. 5—Feed-water heater, boiler feed pumps, separators, pipe work and connections, a total of $19,220. To Alphons Custodis Chimney Contr. Co., of Chicago, Ill., for Sec. 2—Stack, $4,300, and to Moellering Constr. Co., of Ft. Wayne, Sec. 12—Dam in Spy Run, $1,238.

Atoka, Ind. Ter.—The Atoka Light & Power Co. (L. B. Griffing, Mgr.), is contemplating installing a street lighting arc circuit, establishing a day service and making general improvements to its service.

Duncan, Ind. Ter.—The Duncan Light & Power Co. contemplate installing before fall an alternator of 75-kw. capacity, and will also probably install an ice plant.

Mason City, Ia.—The Peoples' Gas & Electric Co. will soon place a contract for a 500-kw. generator direct connected to a 26x48 Corliss engine. The company is planning to furnish a 3-phase power circuit and an alternating-current day service in addition to the direct-current service which the company now furnishes after Aug. 1. The company has secured several contracts to furnish electricity for power purposes. A. W. Zahm, mgr.

Oskaloosa, Ia.—The Oskaloosa Traction & Light Co. will purchase 1 500-h.p. engine, 1 300-kw. 3-phase alternator, 60 cycles, 1 200-kw. Ry. generator and increase station equipment.

Albia, Ia.—The Albia Electric Light & Power Co. propose installing an engine, generator and pump for street railway service.

Manchester, Ia.—F. W. Hoag Electric Light & Power Plant proposes installing a new 80 to 100-h.p. horizontal return flue boiler.

Hiawatha, Kan.—The directors of the Hiawatha Electric Light Co. are reported to have voted to increase the capital stock from $20,000 to $30,000.

Jeanerette, La.—Ed. Stokoe is owner of the Jeanerette Electric Light Plant, which is said to be contemplating adding a Corliss engine direct connected to a 100-kw. Bullock generator to the plant.

De Quincy, La.—C. H. Jenks, of Fayette, Miss., is engineer for the proposed water works and electric light plant. Nothing definite has yet been done.

Westfield, Mass.—Press reports state that contract will soon be let for the proposed new gas holder, with a capacity of 150,000 cu. ft.; probable cost, $25,000. Oren E. Parks, City Engr.

Houghton, Mich.—F. W. McNair, Pres. Michigan College of Mines, writes that Prof. O. P. Hood, of Houghton, has completed plans for the power house and service tunnel to be constructed at the college, and bids for same will be received on July 11; probable cost, $43,000.

**Paw Paw, Mich.*—The contract for constructing a hydro electric power plant and dam on Paw Paw River and certain water works and electric light improvements (bids opened June 25), has been awarded to the Falkenau Electrical Constr. Co., of Chicago, Ill., for $34,964. Engr., A. J. Hammond, of South Bend, Ind.

**Marshall, Minn.*—John R. Gray, City Recorder, writes that J. B. Robertson, Fifillan Blk., St. Paul, has secured the contract for improving electric light plant for $14,497.

Nashwauk, Minn.—The Nashwauk Water & Light Co. (G. A. Lindsay, Supt.), is contemplating making some changes in its present lines, and with the new line will take about 7,000 ft. of wire.

University Place, Neb.—R. E. Shelley, City Clk., writes that Baker & Early, of Lincoln, are preparing plans for an electric light plant to cost about $15,000.

**Niagara Falls, N. Y.*—Wm. C. Thayer, of East Aurora, is reported to have secured the contract for installing outside electric lighting system for State Reservation (bids opened June 21), for about $13,000.

Babylon, L. I., N. Y.—The State Comr. of Gas and Electricity has reported favorably the application of Suffolk Co. Lighting Co. for authority to transact business in Babylon.

Waverly, N. Y.—The State Comr. of Gas and Electricity has granted permission to Sayre Electric Co., of Sayre, Pa., to transact business in Waverly, and also to lease the distributing system of the Waverly Electric Light and Power Co.

Webster, N. Y.—A certificate of authority has been granted to Webster Gas Co. by the State Comr. of Gas and Electricity to operate in Webster, and to issue $10,000 capital stock.

New York, N. Y.—Bids will be received by John H. O'Brien, Comr Water Supply, Gas and Electricity, until July 16, for hauling and laying water mains in West Farms Rd. and in Jennings, Manida and 178th Sts.

New York, N. Y.—Bids will be received until July 15 (readvertisement) at the office of Geo. B. McClellan, Mayor, Chmn. Armory Bd., for furnishing and installing electric lighting fixtures, etc., in 12th Regt. Armory, Boro. Manhattan. Robinson & Knust, Archts., 164 5th Ave., Manhattan.

Corinth, N. Y.—The Corinth Electric Light & Power Co. is reported incorporated, with a capital of $25,000, to operate in Saratoga County. Incorporators: Warren Curtis, of N. Y. City; Warren Curtis, Jr., of Corinth, and E. B. Coolidge, of Glens Falls.

Lowville, N. Y.—The State Gas Commission at Albany is reported to have granted permission to Beaver River Light & Power Co. to conduct business in Lowville also to issue $40,000 stock and $120,000 bonds, and to acquire the stock of the Wetmore Electric Co., now operating in that place.

Tryon, N. C.—G. Hamilton Holmes, of Tryon, Ch. Engr., Tryon Electric Light, Water & Power Co., writes that the water works is nearing completion, and surveys have been completed and plans are now being prepared for power development; cost of proposed power plant, $65,000. Todd Russell, Gen. Mgr.

Sandusky, O.—The Sandusky Gas & Electric Co. is contemplating installing a 120-kw., alternating-current generator this year. E. A. Beckstein, Mgr.

Columbus, O.—Bids will be received until July 30 by the Bd. of Trus. of the Columbus State Hospital (Geo. Stockton, M. D., Secy.), for furnishing and installing complete an engine, dynamo, switchboard and feed wires in the power house and for furnishing material and labor for cement work in the basement of the main building.

Hazelton, Pa.—The Consumers' Electric Light & Power Co. is reported to have decided to build a sub-station.

Kittanning, Pa.—Jas. McCullough, Jr., F. A. Moesta, John A. Fox, C. J. Moesta and H. E. Moesta are stated to have purchased the plant of the Kittanning Electric Light Co. These men own the Kittanning & Ford St. Ry. Co., and by the terms of the purchase secure rights of way for an extension of their road to Mosgrove, 5 miles north of Kittanning.

Charleston, S. C.—Bids will be received at the Bureau of Supplies and Accounts, Navy Dept., Washington, D. C., until July 16, to furnish at the navy yard, Charleston, a quantity of motor-drive outfits, conductor and conduit and fittings. Applications for proposals should refer to Schedule 59. E. B. Rogers, Paymaster Gen'l, U. S. N.

Ft. Sam Houston, Tex.—Bids will be received July 24 by L. J. Fleming, Constr., Q. M., U. S. A., for the following work at this post: Furnishing and installing electric lighting fixtures in the following buildings: Post exchange and gymnasum, post hospital, officers' club, and 2 double stable guard and shop buildings; for the electric wiring in 2 double stable guard and shop buildings; for furnishing pole lines and making service connections to all the buildings before mentioned.

Petersburg, Va.—According to decree recently entered in the U. S. Dist. Court by Judge Waddill, the Virginia Passenger and Power Co. is authorized to expend $50,000 for improvements to the service in this city. The money will be used to install a complete arc lighting system for street lighting in Petersburg, also increasing the water power plant.

Manchester, Va.—The Electric Light Com. of Council, on June 27, recommended that Council construct a municipal electric light plant to cost about $40,000.

Seattle, Wash.—The Seattle Electric Co. is reported about to erect two sub-stations to cost $20,000 each.

Cranbrook, B. C.—The Cranbrook Electric Light & Power Co. (M. Quain, Supt.) is reported to have decided to install a 700-kw. generator, 6,600 volts with step-down transformers. It is also proposed to construct dam on St. Marys River.

Hamilton, Ont.—The Hamilton Cataract Light & Power Co. (W. C. Hawkins, Gen. Mgr.), is reported to have filed plans with the Ontario Ry. and Municipal Bd. for a transmission line through Barton and Saltfleet Townships.

North Battleford, Sask.—Bids will be received until Aug. 7 by S. Cookson, Secy.-Treas., for $100,000 water works, sewerage and electric lighting bonds.

ELECTRIC RAILWAYS.

Notes Arranged Alphabetically by States.

Bisbee, Ariz.—It is reported that the City Council has granted to the Warren Co., a franchise to operate an electric railway through certain streets of the city.

Los Angeles, Cal.—The Los Angeles-Pacific Ry. Co., is stated to have secured a franchise for either a double or four-track electric line from 4th and Western Aves. on Western to the city limits of Hollywood. The company is also applying for a franchise within the city of Hollywood, which will be a continuation of this proposed line. It is said the road will be built within six months.

Denver, Colo.—Incorporation papers for the new electric railway to connect Denver and Greeley to be known as the "Denver & Greeley Railroad," were taken out a few days ago. Frank J. Green, John C. Mosher, E. J. Decker, J. D. Houseman, J. F. Church, of Denver, are reported interested. The company was incorporated with a capital of $50,000, but over $1,000,000 will be expended on the line.

Springfield, Ill.—It is reported announced that the Springfield Consolidated Ry. Co. expects to erect a car house and repair shop.

The road is to be constructed from Chicago in a northerly direction through the counties of Cook and Lake to points on the State line between Illinois and Wisconsin. Incorporators: H. R Yaryan, Lewis E. Starr, Walter F. Wantke, Philip R. Lynch and Geo. W. Miller, all of Chicago.

Northbridge, Mass.—The Selectmen of Northbridge are reported to have signed the franchise granting the Worcester & Blackstone Valley St. Ry. Co. (J. W. Anderson, Supt. Millbury, Conn.), the right to connect its tracks at Plummers with the tracks of the Uxbridge & Blackstone St. Ry. Co.

Jefferson City, Mo.—The St. Louis, Mountain Grove & Southern Ry. Co., of Mountain Grove, is reported to have secured a charter from the Secretary of State. Capital, $300,000. The road is to be 30 miles long, extending from Mountain Grove to Bryant Creek. J. J. Hedges, of Springfield; J. Allbands, of St. Louis, and P. M. Johnston, of Elmo, Ill., are directors.

Rochester, N. Y.—It is stated that the Rochester, Scottsville & Caledonia Electric R. R. Co. proposes extending its line from the present westerly terminus to Le Roy, Stafford and Batavia, a distance of 16 miles.

The Rochester Ry. Co. is reported to be procuring necessary right of way from property owners for the construction of a double track in Andrews St. for the purposes, it is said, of the new union terminal station for interurban roads, for which a large tract of property on Clinton Ave. North and extending from An-

Chittenango, N. Y.—It is reported that at the meeting of the Bd. of Village Trustees, the franchise for which the Syracuse & Chittenango Ry. Co., made application recently was granted.

Buffalo, N. Y.—It is reported that the Buffalo Southern R. R. Co. (C. Brizzer, Ch. Eng., Orchard Park), is planning to build from Buffalo to East Aurora, a distance of about 13 miles.

Sheridan, N. Y.—Henry Graves, Highway Comr. of Sheridan, is stated to have granted a franchise to the Buffalo, Lake Erie & Western Traction Co. to lay tracks across certain highways in Sheridan.

Auburn, N. Y.—The Auburn & Northern Electric R. R. Co. (T. H. Mather, Ch. Engr., Syracuse), is stated to have filed certificates of extension of its line, to begin at the intersection of State and W. Genesee Sts, in Auburn, and continue westward to the city limits, thence through the towns of Aurelius to the Cayuga county line, a distance of approximately 9 miles. The road is then to cross the Cayuga and Seneca canal and Cayuga Lake and go westerly to the village of Seneca Falls, a distance of 2.44 miles.

Hempstead, N. Y.—The State Railroad Comrs. are stated to have authorized the building of a street railroad from Hempstead through Rockville Center to East Rockville, a distance of 5 miles; by the Sea Shore Municipal Ry. Co. Capital, $150,000.

Rochester, N. Y.—The Railroad Comrs. are stated to have granted a certificate of necessity to the Buffalo, Genessee & Rochester Ry. Co., which proposes to build a double-track surface railroad from Depew to Rochester, a distance of 60 miles. The road will run through Lancaster, Crittenden, Corfu, Batavia, LeRoy, and Chili. Capital, $7,500,000.

Hornell, N. Y.—The Board R. R. Comrs. is stated to have granted a certificate of necessity to the Hornell, Bath & Lake Keuka Ry. Co. Capital, $1,000,000. Length of the road about 50 miles.

Portland, Ore.—The Oregon & Washington Lumber Mfrs's. Association, it is said, will co-operate with the Cottage Grove Commercial Club in plans for the building of a railway from Portland to Cottage Grove via the Coast Forks of the Willamette River to connect with the road about to be constructed from Roseburg to Marshfield. A. C. Dixon of the Cottage Grove Commercial Club is reported interested.

Irwin, Pa.—It is stated that the Manor Valley Ry. Co. expects to place contracts during the next 4 weeks

**Items marked thus give the names of parties awarded contracts.*

for the construction of an extension 4 miles in length, to the Pittsburg & Westmoreland Ry. Co., Jas. Bryan, Ch. Engr., Park Bldg., Pittsburg.)

Cowanstonnock, Pa.—The Kittanning & Leechburg Ry. Co. (F. A. Moeston, Gen. Mgr., Kittanning), is reported to have awarded contracts for grading and material for a miles of track from Wrikboro to Cowanstonnock.

Lansdowne, Pa.—The Borough Council is reported to be considering a proposition from the Sharon Hill, Lansdowne and Upper Darby St. Ry. Co. for a franchise over certain streets in the borough. The new line is to be a branch of the United Power & Transportation Co., of Chester. The proposed route is from Sharon Hill Ave. to the terminal at 69th St., Philadelphia.

Bradford, Pa.—The Western New York and Pennsylvania Traction Co. (W. R. Page, Gen. Mgr.), is reported to have announced that an electric line from Eldred to State Line which would connect with the Bradford-Olean line, will be constructed.

Newberry, S. C.—The City Council is stated to have granted a franchise to the South Carolina Public Service Corp. for a right of way on several streets for the construction of an electric car line, obect of the corporation being to include this city in the chain of towns which will be connected by a trolley line.

Chattanooga, Tenn.—It is reported to have been announce that the Chattanooga Rys. Co. (D. J. Duncan, Gen. Mgr.), will construct a surface line to the summit of Lookout Mountain. Other improvements of an extensive nature are also to be made by the company immediately. Surveys have also been made for a line to Lula Lake and Minnehaha Falls, at which point it is proposed to put in a park.

Ft. Worth, Tex.—It is stated that the Northern Texas Traction Co. is planning to build about 2 miles of street railway track in North Ft. Worth.

Vancouver, Wash.—Mayor J. R. Harvey is reported to have signed the ordinance granting to Walter H. Moore the franchise for a street railway on 11th, Jefferson and 13th St. and Kaufman Ave. to the city limits.

Vancouver, B. C.—Jas. Milme, Gen. Supt. of the British Columbia Electric Ry. Co., Ltd., is reported to have announced that the construction during the next two years of about 60 miles of road from Westminster to Chilliwack, B. C., is contemplated. This does not include extensions to the lines in Vancouver, Westminster and Victoria.

Ft. Francis, Ont.—The construction of an electric railway from Fort Francis to Duluth is reported under consideration. Power will be available upon completion of the power dam at International Falls on Rainy River. W. H. Elliott, of this place, is interested.

Pt. Arthur, Ont.—The City Council is reported to have decided to double track the municipal electric street railway system at a cost of approximately $55,000. Following are some of the materials required: 620 tons of 56-lb. nails, 18 tons of spikes, 4 tons of bolts, 18,480 ties, 14,868 lbs. of 00 trolley wire, 280 trolley hangers, 300 double pull-overs, 1,500 lbs. 7-strand No. 2 wire. J. M. McTeikue is clerk.

RAILROADS.

Notes Arranged Alphabetically by States.

Little Rock, Ark.—Local press reports state that the Chicago, Rock Island & Pacific R. R. Co. (J. M. Stark, Asst. Engr., Little Rock), have completed plans for terminals, to cost $400,000, and have 15 miles of trackage. It also proposes erecting shops and roundhouse in southeastern part of city.

Augusta, Ga.—It is reported that the Georgia & Florida R. R. Co. has rejected bids opened on the connecting link contract, and will again ask for new bids. The work calls for the construction and laying down of several hundred miles of track between Augusta and Madison, Fla., involving the expenditure of several hundreds of thousands of dollars.

Pelham, Ga.—The Southern Eng. Contr. Co., of Atlanta, applied for a charter to build and operate a railroad from Pelham to Leary and Newton, Ga. A draw bridge will be erected over Flint River at Newton. This road will connect the Central of Georgia and the Atlantic Coast Line.

Y., and Guantanamo, Cuba, etc.: Schedule 31—Rebuilding brick wall. Schedule 36—Rails, frogs, etc. Schedule 37—Ties, c. i. pipe and specials, valves, sewer pipe, cement block machine, etc. Schedule 38—Asphalt. Schedule 40—Galvanized iron. Newport, R. I.: Schedule 11—Construction of walks. Schedule 12—Construction of walls. Schedule 13—Dredging. Schedule 14—Installation of steam distributing system. Schedule 16—Turbine bucket cutting machines. Portsmouth, N. H.: Schedule 38—Hoop brass and iron. Boston, Mass.: Schedule 39—Gaskets. Norfolk, Va.: Schedule 33—Creosoted piles. Charleston, S. C.: Schedule 15—1 hand resawing machine. Pensacola, Fla.: Schedule 15—1 traveling crane. Also until July 16: Portsmouth, N. H.: Schedule 61—Sheet copper, galvanized sheet steel, copper pipe, etc. Schedule 62—Hemlock, white pine, steel cement, etc. New York, N. Y., and Guantanamo, Cuba, etc.: Schedule 55—Steel cars, etc. Schedule 60—Steel plates. Schedule 61—Copper pipe. Schedule 67—Rolled bronze, copper, bar iron and steel. League Island, Pa.: Schedule 59—Electrical conductor and conduit. Schedule 61—Galvanized sheet steel, ingot tin, copper pipe. Schedule 66—Drills, pipe fittings, valves, etc. Schedule 67—Brass, bronze, copper, bar iron and steel. Pensacola, Fla.: Schedule 63—Bolts, etc., yellow pine plank and piles, bar iron. Schedule 64—Iron or steel pipe, valves, etc. Norfolk, Va.: Schedule 55—Portland cement, gravel, sand, ties, steel angles, rails. New Orleans, La.: Schedule 63—Electrical supplies. Also until July 23: Mare Island, Cal.: Schedule 46—Broken stone, sand, Oregon pine, corrugated steel, steel shapes and plates, rails. Schedule 47—Broken stone, Portland cement, brick, sand, lumber, platinum, bar iron, corrugated steel, steel shapes and plates, rails, etc. Schedule 48—Steel plates. Schedule 49—Oregon pine, tallow wood, iron or steel pipe, steel tubing, copper pipe, etc. Puget Sound, Wash.: Schedule 48—Steel, plates, shapes, bars, billets and beams. Schedule 52—Rolled bronze, bar steel, galvanized sheet steel, brass, copper, and iron or steel pipe, etc. Applications for proposals should designate the schedules desired by number. E. B. Rogers, Paymaster Gen'l, U. S. N.

Takoma (Washington), D. C.—Bids will be received by Maj. J. T. Crabbs, Q. M., Walter Reed Army Hospital, Takoma Substaton, Washington, D. C., until July 18 for constructing concrete conduit on reservation of hospital, approximately 1,000 ft. long, 8 ft. wide and 5 ft. high, covered with concrete slabs, as advertised in The Engineering Record.

Streator, Ill.—The Streator Fuel Co. is reported to have decided to sink a coal shaft; cost, $25,000.

Richmond, Ind—See "Railroads."

Carroll, Ia.—It is stated that bids will be received until July 24 by the Bd. Co. Superv., for constructing a ditch. Peter Stephany, Co. Aud.

Emmetsburg, Ia.—Bids will be received until Aug. 7 by the Bd. Co. Superv. for constructing drainage improvements in the following districts: Nos. 12, 15, 16, 17, 18, 19 and 24. Bids to be submitted separately on each district. Sim. R. Stedman, Co. Aud.

Houghton, Mich.—See "Power Plants, Gas and Electricity."

Petit Rocher, N. B.—It is stated that bids will be received until July 15 by Fred Gelinas, Secy. Dept. Pub. Wks., Ottawa, Ont., for the construction of an extension from the breakwater to the shore at Petit Rocher.

Oswego, N. Y.—The citizens are reported to have voted on June 25 to issue $7,000 bonds for the construction of a dam across Susquehanna River in Owego.

Brooklyn, N. Y.—Bids will be received by Park Bd. (Moses Herrman, Pres.), New York City, until July 18, for furnishing material and constructing riprap sea wall along Bay Ridge Parkway, from Wakeman Pl. to Ft. Hamilton Ave., Boro. Brooklyn, together with all work incidental thereto.

The Bd. of Aldermen is reported to have on June 25 voted to give Park Commissioner Kennedy an appropriation of $266,567 for the maintenance of park system in Brooklyn and Queens. Some of the money is to be expended as follows: $60,000 for a shelter and locker house in McLaughlin Park; $35,000 for making improvements to Eastern Parkway; $25,000 for Highland Park, and $50,000 for Sunset Park.

New York, N. Y.—The Municipal Art. Comn on June 27 approved the designs for pier buildings for the Chelsea improvement, running from 11th to 23d Sts., North River, and to cost several million dollars.

Bids will be received by Jas. W. Stevenson, Comr. of Bridges, until July 18 for furnishing and delivering spruce plank for the Brooklyn Bridge during the year 1907.

Panama.—The following are the bids opened on June 28 by the Isthmian Canal Comn. at Washington, D. C., for one or two suction dredges: Maryland Steel Co., Sparrows Point, Baltimore, Md., 2 dredges (one in 150 days and two in 185 days), f. o. b. cars or vessel at factory, $173,500; Merrill Stevens Co., Jacksonville, Fla., one dredge 240 days, f. o. b. factory, $99,800; The Moran Co., Seattle, Wash., one dredge 8 months at works, $133,000; Newport News Shipbuilding & Dock Co., New York, N. Y., two dredges, 270 and 300 days, del. at Newport News, $165,000; Atlantic Equipment Co., 111 Bway., New York, N. Y., two dredges, one 320 days and two 410 days, delivered beside vessel in New York, $236,500; The Bucyrus Co., South Milwaukee, Wis., one 235 days and two 260 days, on cars in New York, or on ship for $550 each additional, one to cost $98,800, and two for $191,800; Lobnitz & Co., 32 Bway., New York, N. Y., two dredges, 250 days, in New York, $188,560.

Bids will be received by D. W. Ross, Genl. Purchasing Officer, Isthmian Canal Comn., Washington, D. C., until July 16, for furnishing steam shovels, unloader plows, car replacers, jacks, rail benders, iron pipe and fittings, valves, bibbs, gauge cocks, steel wool, etc., as per Circular 374.

San Juan, P. R.—Bids will be received until Aug. 3 by L. H. Grahams, Comr. of the Interior, San Juan, for the repair and rental for a period of 15 years of the iron pier located at La Puntilla in the city of Mayaguez. The necessary repairs have been estimated at $36,394.

*Sabine Pass, Tex.—Bids were opened on June 15 by Capt. J. F. McIndoe, Corps. Engrs., U. S. A., New Orleans, La., for jetty work at Sabine Pass, and the bid of Chas. Clarke & Co., of Galveston, has been recommended for acceptance. They bid for sandstone and granite, half in half, $2.59⅞ cts. per ton; total cost, $259,875. About 100,000 tons of material will be required.

**Items marked thus give the names of parties awarded contracts.*

CURRENT NEWS SUPPLEMENT

JULY 13, 1907.

DIRECTORY OF NATIONAL TECHNICAL AND TRADE SOCIETIES.

AMERICAN SOCIETY OF CIVIL ENGINEERS. Secretary, Charles Warren Hunt, 220 West 57th St., New York.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS. Secretary, Calvin W. Rice, 29 West 39th St., New York.

AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS. Secretary, Ralph W. Pope, 29 West 39th St., New York.

AMERICAN INSTITUTE OF MINING ENGINEERS. Secretary, R. W. Raymond, 29 West 39th St., New York.

NATIONAL FIRE PROTECTION ASSOCIATION. Secretary, W. H. Merrill, Jr., Chicago.

AMERICAN INSTITUTE OF ARCHITECTS. Secretary, Glenn Brown, Washington, D. C.

ASSOCIATION OF ENGINEERING SOCIETIES. Secretary, Frederick Brooks, 31 Milk St., Boston, Mass.

AMERICAN SOCIETY OF HEATING AND VENTILATING ENGINEERS. Secretary, W. M. Mackay, 113 Beekman St., New York. Semi-annual meeting, Milwaukee, Wis., July 18-19, 1907.

CANADIAN SOCIETY OF CIVIL ENGINEERS. Secretary, Clement H. McLeod, 877 Dorchester St., Montreal.

SOCIETY FOR THE PROMOTION OF ENGINEERING EDUCATION. Secretary, Prof. M. S. Ketchum, University of Colorado, Boulder, Col.

AMERICAN SOCIETY FOR TESTING MATERIALS. Secretary, Prof. Edgar Marburg, University of Pennsylvania, Philadelphia, Pa.

AMERICAN SOCIETY OF MUNICIPAL IMPROVEMENTS. Secretary, George W. Tillson, Room 12, Municipal Building, Brooklyn, N. Y.

ASSOCIATION OF RAILWAY SUPERINTENDENTS OF BRIDGES AND BUILDINGS. Secretary, S. F. Patterson, Concord, N. H.

AMERICAN RAILWAY ENGINEERING AND MAINTENANCE OF WAY ASSOCIATION. Secretary, E. H. Fritch, 962 Monadnock Block, Chicago.

AMERICAN WATER WORKS ASSOCIATION. Secretary, J. M. Diven, Charleston, S. C.

AMERICAN STREET AND INTERURBAN RAILWAY ASSOCIATION. Secretary, Bernard V. Swenson, 29 West 39th St., New York.

AMERICAN FOUNDRYMEN'S ASSOCIATION. Secretary, Richard Moldenke, P. O. Box 432, New York.

ENGINE BUILDERS' ASSOCIATION OF THE UNITED STATES. Secretary, J. L. Lyle, 39 Cortlandt St., New York.

AMERICAN PUBLIC WORKS ASSOCIATION. Secretary, W. H. Flint, Chattanooga.

ASSOCIATION OF AMERICAN PORTLAND CEMENT MANUFACTURERS. President, J. B. Lober, 1232 Land Title Building, Philadelphia.

NATIONAL ASSOCIATION OF CEMENT USERS. President, Richard L. Humphrey, Harrison Building, Philadelphia.

AMERICAN SOCIETY OF REFRIGERATING ENGINEERS. Secretary, H. W. Ross, Room 806, 258 Broadway, New York.

AMERICAN PUBLIC HEALTH ASSOCIATION. Secretary, Dr. C. O. Probst, Columbus, O.

PERSONAL NOTES.

Mr. D. A. Reed, of Duluth, Minn., is at the head of the Minnesota Engineering Co., recently organized in that city.

Mr. H. H. Hadsell, assistant bridge engineer for the Illinois Central R. R., has resigned to become connected with the Leonard Martin Construction Co., of Chicago.

Mr. Richard T. Fox, of Chicago, has been engaged by a citizens' committee of Boston to investigate the condition of the streets and street department of the latter city.

Prof. William R. Hoag has retired from the faculty of the civil engineering department of the University of Minnesota and will engage in private practice in Minneapolis.

Mr. George P. Carver has opened an office in the Exchange Building, 53 State St., Boston, Mass., as a specialist in the design and construction of reinforced concrete structures.

Mr. B. J. Fallon, formerly assistant engineer on the Chicago, Burlington & Quincy R. R., has been appointed engineer of maintenance on the Metropolitan West Side Elevated R. R., of Chicago.

Mr. Gilbert C. White has opened an office as a consulting engineer in Durham, N. C. He will give special attention to water-works, sewerage, street improvements and kindred engineering problems.

Mr. William S. Menden, chief engineer of the Brooklyn Rapid Transit Co., Brooklyn, N. Y., has been appointed general superintendent of the company, succeeding Mr. Dow S. Smith, resigned.

Dr. Walter Bensel, sanitary superintendent of the Department of Health of New York City, has been appointed Street Cleaning Commissioner of that city, succeeding Mr. McDonough Craven, resigned.

Mr. B. J. Sigmund has resigned as chief assistant engineer with Messrs. Tucker & Vinton, New York City, to accept a similar position with the Concrete Engineering & Supply Co., of the same city.

Mr. Wm. D. Batchelor, of Nutley, N. J., who for the past fifteen years has been chief engineer of the structural department of Milliken Bros., Inc., New York City, has resigned owing to the recent failure of the firm.

Mr. L. E. Moore, instructor in theoretical and applied mechanics, University of Illinois, has been appointed assistant professor of civil engineering in the Massachusetts Institute of Technology, succeeding Prof. F. P. McKibben, resigned.

Mr. H. H. Knowlton, division engineer, of the Cleveland, Cincinnati, Chicago & St. Louis Ry., at Shelbyville, Ind., has been appointed engineer of maintenance of way on the Cairo division of that railroad, with headquarters at Mt. Carmel, Ill.

Mr. George R. Bascom, until recently a pitometer expert in charge of waste-water investigations for the water department of Philadelphia, is now engaged with Messrs. John A. & Edward S. Cole, consulting engineers of Chicago and New York.

Mr. Luis Barragan, chief engineer of the water-works of San Luis Potosi, Mexico, is in this country studying water purification plants. He has investigated the water-works of San Antonio, St. Louis, Charleston, W. Va., Washington and Philadelphia.

Smith, Emery & Co., Inc., inspecting, testing and chemical engineers and chemists, have removed their general offices from Oakland, Cal., to their new building at 651 Howard St., San Francisco. The Oakland office and laboratory will remain at 1068 Broadway.

Mr. Curtis Hill, of St. Louis, has been appointed State Highway Engineer of Missouri by the State Board of Agriculture. He will begin at once the engineering work on the highway between St. Louis and Kansas City, authorized at the last session of the legislature.

Messrs. G. L. Hosmer, C. B. Breed and George E. Russell have been promoted to be assistant professors of civil engineering in the Massachusetts Institute of Technology. Messrs. Hosmer and Breed are the authors of a text-book of surveying published a year ago.

Maj. Chester Harding, Corps of Engineers, U. S. A., in charge of the construction of the municipal building for the District of Columbia, has been ordered to Panama and report to Col. G. W. Goethals for duty as division engineer of the Gatun division of the Panama Canal.

Mr. Mortimer G. Barnes, of Petersburg, Neb., has been appointed a division engineer of the Board of Water Supply, of New York City, and Messrs. Stephen Koronski and Clifford Lynde, of Philadelphia and Oil City, Pa., respectively, have been appointed assistant engineers in the same department.

Mr. Ira A. McCormack has resigned the position of assistant to the general manager of the New York Central & Hudson River R. R. to become president and general manager of the Randolph & Cumberland Ry., between Cameron and Hillsons, N. C. This company is to construct 216 miles of new road.

Mr. Joseph Hobson, chief engineer of the Grand Trunk Ry. System, with headquarters in Montreal, has been appointed consulting engineer of the system and has been succeeded as chief engineer by Mr. Howard G. Kelley, formerly chief engineer of the Minneapolis & St. Louis R. R. Mr. William McNab has been appointed principal assistant engineer.

Dr. Henry S. Pritchett, president of the Massachusetts Institute of Technology for the past seven years, who resigned about six months ago, ended his service with the college recently. Owing to the failure of the trustees to secure a permanent head for the school, Arthur Ames Noyes, professor of theoretical chemistry, is to act as president until the vacancy is filled.

Brig.-Gen. Barry, U. S. A., commanding the Army of Cuban Pacification, has written a letter to Gen. Alexander Mackenzie, Chief of Engineers, U. S. A., in which he commends highly the services rendered during the past few months by the 2d and 3d Battalions of Engineers in Cuba. These battalions have returned to the United States and are stationed at Washington Barracks and Fort Leavenworth, respectively. Gen Barry Says: "Their discipline has been excellent: all work required of them has been expeditiously performed, and in road building, reconnaissance, surveying and map making they have exceeded expectations and astonished the natives."

Mr. A. W. Dow, of New York, formerly inspector of asphalts and cements for the City of Washington, D. C., and Mr. F. P. Smith have formed a partnership under the firm name of Dow & Smith, as consulting engineers on road surfacing and reservoir waterproofing, the distillation and refining of oils and all work involving the use of asphalts or bitumens of any kind. Mr. Dow is well known as a specialist in paving materials and Mr. Smith has had a long experience in refining and laying asphalts, both in this country and abroad, having been chemist and asphalt expert for the Alcatraz Co., the Union Oil Co. of California, the British Paving Co., Ltd., and the A. L. Barber Asphalt Co. and chemist for the United States Navy Department for a number of years.

The Interstate Commerce Commission has appointed the following commission to conduct tests of signal systems and other safety devices: Prof. M. E. Cooley, chairman; Capt. A. Ames, Jr., Messrs. Frank G. Ewald and B. B. Adams. The American Railway Association has appointed the following committee to co-operate with the federal commission: General Inspector F. C. Rice of the Burlington system, General Superintendent A. M. Schoyer of the Northwestern road, Vice-President W. G. Besler of the Central R. R. of N. J., General Superintendent A. T. Dice of the Philadelphia & Reading Ry., Chief Engineer E. C. Carter of the Northwestern road, and Asst. General Manager Moon of the Lake Shore road. This committee has offered to provide tracks and other facilities for the tests.

Mr. Hermann von Schrenk, pathologist in charge of investigations of timber diseases and methods for their preventing, in the United States Department of Agriculture for the past ten years, and Messrs. E. B. Fulks and Alfred L. Kammerer, who were connected with the timber preserving work of the Department of Agriculture for several years and for the past two years have been conducting timber preserving investigations for various railway companies, have opened an office in St. Louis, Mo., as consulting timber engineers, under the firm name of Von Schrenk, Fulks and Kammerer. The firm announces that it is ready to make reports on logging methods, manufacture of lumber, wood pulp manufacture, the seasoning and preservation of timber, railway timber, bridge and track construction, and kindred matters.

The Society for the Promotion of Engineering Education, at its recent convention in Cleveland, O., elected the following officers for next year: President, Chas. S. Howe, Case School of Applied Science; first vice-president, C. A. Waldo, Purdue University; second vice-president, W. G. Raymond, University of Iowa; third vice-president, A. L. Williston, Pratt Institute; treasurer, W. O. Wiley, New York; councillors for three years: F. W. Atkinson, Brooklyn Polytechnic Institute; M. E. Cooley, University of Michigan; W. S. Franklin, Lehigh University; William Keith, Syracuse University; W. B. Russell, New York Central R. R.; C. F. Scott, Westinghouse Electric Co., and H. B. Smith, Worcester Polytechnic Institute. The society voted to invite the American Society of Civil Engineers, the American Society of Mechanical Engineers, the American Society of Chemical Industry and the American Mining Institute to join in a movement to promote elementary technical education.

Louis J. Magee, well known as an electrical engineer and authority on the construction and operation of electric street railways, died recently at his home in New York City, aged 45 years. He was born in Malden, Mass., and was graduated from Wesleyan University in 1885. In the same year he entered the shops of the Thomson-Houston Electric Co. with which he was associated for several years, being at one time manager of its European office at Hamburg. He organized and was resident manager at the Union Electric Co., of Berlin, which was merged with the General Electric Co., of Germany, in 1903. In the last three years he had much to do with the arrangements between the General Electric Co., of Schenectady, and the German company in exchanging men for the widening of technical experience. Mr. Magee was a frequent contributor to trade and technical magazines. He was a member of scientific societies here and abroad, and of the Lawyers' and Engineers' clubs, of New York City.

Major [illegible] F. Hodges, assistant to the Chief of Engineers, Corps of Engineers, U. S. A., after the reorganization of the Washington headquarters of the Isthmian Canal Commission as planned by the Secretary of War will have charge of the purchasing of all supplies and materials for the canal work and will be "general chief of office" in Washington. Mr. Joseph B. Bishop, secretary of the Isthmian Canal Commission, will, in accordance with the reorganization plans, proceed to the Isthmus about Aug. 1 and will make his headquarters there hereafter. Under the new plan the Washington office will be reduced to the smallest organization compatible with efficient service. The auditing division will be abolished, as much of the correspondence division will be transferred to the Isthmus as is practicable, and there will remain in the Washington office only the purchasing division, the disbursing division, and three sections devoted to records, appointments and correspondence, respectively. Lieut.-Col. Smith S. Leach has been appointed to succeed Major Hodges as assistant to Gen. Alexander Mackenzie, Chief of Engineers, U. S. A. Col. Leach is a member of the General Staff.

BUSINESS NOTES.

The Metropolitan Engineering & Construction Co., Chicago, has been awarded a contract for paving about 10,000 square yards of streets in Ravenswood, a suburb of Chicago, with Sarco Brand of asphalt made by the Standard Asphalt & Rubber Co.

In order to handle its large trade in electric generators and motors in soutern Ohio, the Cleveland office of the Crocker-Wheeler Co., has opened a sub-office at Columbus, in the Columbus Savings & Trust Co. Bldg. It will be in charge of Mr. Chas. W. Cross.

Mr R. E. Fox, Jr., has resigned the management of the New York office of the Platt Iron Works Co., to become secretary and manager of The Engineer Co., 111 Broadway, New York city. Mr. Fox was for three years manager of the southern territory of the former company, with headquarters at Atlantic, Ga. The Engineer Co. manufactures and installs the balanced draft system of furnace regulation.

The Terry Steam Turbine Co., Hartford, Conn., has just secured the order for eight 300 h. p. steam turbines for the new Waterside plant of the New York Edison Co., 39th Street and First Avenue, New York city. These turbines are to be used direct connected to centrifugal pumps and are for boiler feed purposes. The capacity of each turbine pump unit will be 1,000 gal. per minute, against a pressure of 300 pounds. The New York Edison Co. has been using three of these steam turbine driven centrifugal pumps for boiler feed for the past year.

Medusa water-proof compound, made by the Sandusky Portland Cement Co. is being used on the following work: exterior plaster of the Coliseum, Niagara Falls, N. Y., to prevent discoloration and efflorescence caused by the spray of the Falls; Tryst Crystal Ice & Storage Co., reinforced concrete tanks; Hygeia Ice & Storage Co., Poughkeepsie, N. Y.; bakery of Baur Bros., Pittsburg; American Car & Foundry Co., Pendleton Investment Co., and Dair's Estate Bldg., St. Louis swimming pool, foundation and cellar of the Olympic Club building, San Francisco.

The car dumping machine, recently installed by the McMyler Mfg. Co., at the Hanna docks, in Sandusky, has been making some unusual good records, eighty cars being unloaded in five hours on one occasion. The machine was built by the Riverside Bridge Co., of Martin's Ferry, O.

R. Hoe & Co., New York, have added a new foundry to their plant, and will equip it with a Newton cupola and three ten-ton overhead electric traveling cranes made by the Northern Engineering Works, Detroit, Mich.

The Bonner Portland Cement Co. has awarded the contract for the engineering on its new plant at Bonner Springs, Kan., to the Freeborn Engineering & Construction Co., Kansas City, Mo. Work on the construction is already under way.

The Eureka Machine Co. moved into its new factory at Lansing, Mich., on July [illegible]. The building is a [illegible] concrete structure, and gives the company [illegible] the larger capacity necessary for meeting [illegible].

Mr. [illegible], president of the Chicago Portland Cement Co., [illegible] denial of the report that his company [illegible] a consolidation with the German-American Portland Cement Works and the [illegible] Cement Manufacturing Co.

The Kansas City Portland Cement Co., Kansas City, [illegible], has just completed [illegible] from the plans of W. H. Caffery, of the same city, and is now building another mill at Bonner Springs, Kan. Limestone [illegible] obtained in [illegible] raw materials. [illegible] crushers, Hamilton [illegible] engines, Jeffrey hammer [illegible], Allis-Chalmers [illegible] Kuppel industrial [illegible] Griffin mills [illegible]. The kiln room [illegible] kilns.

CONTRACTING NEWS

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS, ENGINEERS AND MANUFACTURERS ENGINEERING AND BUILDING SUPPLIES

WATER.

Notes Arranged Alphabetically by States.

Florala, Ala.—S. M. Fambrough, in care of J. B. McCrary & Co., of Atlanta, Ga., is preparing plans for water works and a sewerage system, to cost about $30,000.

Los Angeles, Cal.—The following are the bids recently received by the Dept. of Public Works, Aqueduct Dept., for (*a*) 13,000 ft. 6 in. No. 16 gage, riveted sheet steel pipe, delivered f. o. b. cars Los Angeles; (*b*) 5,000 ft. 8 in. No. 14 gage riveted sheet steel pipe, f. o. b. cars Los Angeles: F. K. Simonds Co., Los Angeles, Cal., *a* 24¾ cts, *b* 30½ cts; Lacy Mfg. Co., Los Angeles, *a* 23 cts., *b* 33 cts.; J. D. Hooker Co., Los Angeles, *a* 22 cts. *b* 33 cts.

Wauchula, Fla.—H. E. Whitehead, of Tampa, writes that it is proposed to construct water works at Wauchula, to cost about $10,000, work to be done by day labor.

Millen, Ga.—See "Power Plants, Gas and Electricity."

Milner, Idaho.—Bids will be received until Aug. 1 by Paul S. A. Bickel, Ch. Engr., Twin Falls, North Side and & Water Co., Milner, for constructing 16 miles of canal containing about 30,000 perch of rough rubble masonry, 25,000 cu. yds. lava rock excav., 680,000 cu. yds. earth embankment.

East Moline, Ill. The City Council is reported to be considering the question of constructing municipal water works.

Decatur, Ill.—Albert Leach, City Clk., writes that bids will be received on July 26 for water works, to cost about $32,000. Engineer, D. W. Mead, 401 State St., Madison, Wis.

Chesterton, Ind.—Bids will be received by the Chesterton Water Co. until July 20 for the construction of water works, as advertised in The Engineering Record.

Poteau, Ind. Ter.—Bids are wanted for construction of pumping station. Plans and specifications can be had from M. W. Murray, Mayor.

Eufaula, Ind. Ter.—Bids will be received until July 16 by this city for the purchase of boilers, pumps, heaters, boiler feed pumps, hydrants and valves, c. i. pipe and other water works material. The O'Neil Eng. Co., Engrs., Dallas, Tex.

Lamont, Ia.—A contract for constructing waterworks for Lamont is reported to have been awarded to the Des Moines Iron & Bridge Co., of Des Moines, for $4,100, which calls for a steel tower 118 ft. high, steel tank with a capacity of 30,000 gals., and distributing mains. The contract for the well, pumping engine and building has not yet been awarded.

Wyandotte, Mich.—We are informed that the Bd. of Pub. Wks. is now ready to communicate with sanitary engineers relative to preparing necessary plans and specifications for construction of a filtration plant in connection with the present water-works. Address all communications to Jas. G. Pinson, Secy. Bd. of Pub. Wks.

Hoboken, N. J.—The Water Bd. is reported to have on June 26 opened bids for building a 30-in. water main from 17th St. to Ferry St. on Bloomfield St.; Kavanagh & Heagney, $84,408; Palisade Constr. Co., $88,176; Tumilty & Cutley, $92,380; John C. Tierney $94,516; Henry Waddington, $97,744, and M. T. Connolly, $117,420.

Ft. Hancock, N. J.—Bids will be received by M. N. Falls, Constr. Q. M., U. S. A., until Aug. 9 (readvertisement), installing a filtration plant at Ft. Hancock, as advertised in The Engineering Record.

Brooklyn, N. Y.—Bids were opened on July 3 by John H. O'Brien, Comr. Water Supply, Gas and Electricity, for furnishing, delivering and laying force mains and removing existing force mains at site of Ridgewood pumping station: J. H. Holmes, 87 Nassau St., $59,707; Hammond & Sloane, 60 Wall St., $58,258; Borough Constr. Co., 21 Court St., $65,368; John F. Mead, $52,525; and Schawmut Constr. Co., 41 Park Row, $56,784.

*Press reports state that the Bd. of Estimate on July 8 authorized Deputy Com. Cozier to enter into a contract with Cyrus Titus to furnish Brooklyn with an additional supply of water amounting to 10,000,000 gals. per day. This water will be obtained by Mr. Titus within the borough limits by a system of sunken wells. He is to receive $55 for each million gals., and at the end of 5 years his plant is to become the property of city.

**Mineola, L. I., N. Y.*—Engr. Walter E. Sexton, 46 N. 12th St., Philadelphia, Pa., writes that bids were opened on June 21 by the Village Trus., for water works, and contracts were awarded as follows: To Camden Iron Wks., Philadelphia, Pa., 4-in. pipe $36.90 per ton, and 6, 8 and 10-in. pipe $35.40, special castings 3 cts. per lb.; to Fairbanks & Co., Philadelphia, Pa., fire hydrants, valves and valve boxes; to Platt Iron Wks., Philadelphia, Pa., pumps, $1,160; to Alma Mfg. Co., Philadelphia, Pa., 25-h.p. engine, $960; to Belmont Iron Wks., Philadelphia, Pa., tank and tower, $8,477; and to Fritz & Partridge, Dover, N. J., for laying 4-in. pipe 22 cts., 6-in. pipe 25 cts., 8-in. pipe 28 cts., and 10-in. pipe 32 cts., setting pump $500, building power house $1,473, setting hydrants $3 ea. building pump pit $1,095, and concrete work $8 per yd.

West Point, N. Y.—Bids will be received by the Quartermaster, U. S. M. A., until July 20 for the construction of two covered slow sand filters each about ½ of an acre in extent, as advertised in The Engineering Record.

Buffalo, N. Y.—Bids will be received until July 18 by F. G. Ward, Comr. Pub. Wks., for building foundations for new water works pumping station, on lands bet. Jersey St., Porter Ave., the New York Central R. R., and Harbor line.

New York, N. Y.—Bids will be received by John H. O'Brien, Comr. Water Supply, Gas and Electricity, until July 16, for hauling and laying water mains in West Farms Rd., and in Jennings, Manida and 178th Sts.

The following are the bids opened on July 3 by John H. O'Brien, Comr. of Water Supply, Gas and Electricity, for (*a*) 5,600 tons straight pipe, (*b*) 600 tons of specials: U. S. Cast Iron Pipe & Fdy. Co., 71 Bway., *a*, $32.00; *b*, $65; M. T. Drummond Co., 182 Bway., *a*, $32.20; *b*, $54; John Fox & Co., 258 Bway., *a*, $35.35; *b*, $57.40; Warren Fdy. & Machine Co., 170 Bway., *a*, $34.90; *b*, $60.

The lowest bid opened July 3 by John J. O'Brien, Comr. Water Supply, Gas and Electricity, for furnishing, delivering and laying water mains in Blondell, Barnes, Byron, Devoe, Edwards, Ellison and other streets was submitted by the Wilton Constr. Co., 115 Elliott Ave., at a total of $68,969. They bid for 915 tons straight pipe, $36.45; 40 tons specials, $763; 75 tons gate boxes, $53; 20 cu. yds. rock without blast, $30 cts.; 2,500 cu. yds. rock, 30 cts.; 90 cu. yds. masonry, 30 cts.; 17,300 cu. yds. earth, 30 cts.; 17,600 cu. yds. fill, 30 cts.; 13,900 lin. ft. 12-in. pipe to lay, 29 cts.; 17,700 lin. ft. 6-in. pipe to lay, 15 cts.; 50 lin. ft. 4-in. pipe to lay, 15 cts.; 550 lin. ft. 4-in. screw pipe, $3.50; to set ate. valves and hydrants ea., 50 cts., and for pavt. 1 ct. per sq. yd., and curb 1 ct. per cu. ft. Totals of other bids: L. D. Gregory, 125 th St. and 1st Ave., $75,806; Wm. F. Norton, 27 W. 140th St., $85,169, and Burns & Rodgers, 1929 Amsterdam Ave., $76,149.

Bids will be received by the Bd. of Water Supply (Thos. Hassett, Secy., 299 Bway.), until Aug. 6 for the construction of the main dams for Ashokan reservoir near Brown Station in the towns of Olive and Marbletown, Ulster County, as advertised in The Engineering Record. J. Waldo Smith, Ch. Engr.

Irvington, N. Y.—Bids will be received until July 23 by the Bd. of Water Comrs. (Jas. G. Orton, Clk.) for furnishing material and laying about 3,000 ft. 12-in. c. i. water pipe, making connections, and doing all work in connection with the same.

Jamestown, N. Y.—Bids will be received until Aug. 1 by the Bd. of Water Comrs. (Clement B. Jones, Secy.), for laying a water main of appromimately 12,000 ft. of 16-in. and 750 ft. of 12-in. pipe, as advertised in The Engineering Record.

Flushing, L. I., N. Y. Bids will be received until July 22 by C. B. J. Snyder, Supt. School Bldgs., N. Y. City., for water main, etc., to building for Parental School on road bet. Flushing and Jamaica, about 1,700 ft. south of Hempstead turnpike, Flushing, Boro. of Queens.

Hamilton, O.—Bids will be received by the Bd. of Pub. Service until July 18 for furnishing material, etc., and erecting chimney, receiving well and pipe and special castings and the engine and boiler foundations, etc., as advertised in The Engineering Record.

Pulaski, O.—The Pulaski Water Co. is reported organized with a capital of $20,000 by Norman N. Rogers and Chas. Simpson, of Pulaski, and David Tod, of Youngstown. The company has purchased the Sarah A. Kyle property in Pulaski and will furnish water to New Castle and Youngstown.

Portsmouth, O.—It is stated that active steps are being taken here to improve the water supply.

**Medina, O.*—T. C. Brooks & Sons, of Jackson, Mich., has secured the contract for water pipes and development of natural filter (bids opened June 21 by the Bd. of Pub. Service) at a total of $25,360, including hydrants, valves, etc. They bid for 24,432 ft. excav. in trench, 12 cts.; 7,600 ft. 4-in. c. i. pipe, laid, 42 cts.; 1,566 ft. 6-in. c. i. pipe, laid, 70 cts.; 13,338 ft. 8-in. c. i. pipe, laid, $1.09; 50 ft. 12-in. c. i. pipe, laid, $2.04; 1½ ton c. i. specials, $100 per ton; 730 ft. 8-in. vitr. pipe, laid, 20 cts.; 630 ft. 6-in. vitr. pipe, laid, 20 cts.; 693 cu. yd. excav. at river, $1.20; 76 cu. yd. concrete, $10; 10 1-in. steel rods, 4 ft. long, 20 cts.; 36 cu. yd. gravel backing, 50 cts.; flash boards, $15. Totals of other bids: Nugent & Smith, Medina, O., $36,875; Devine, Wilson & Applegate, Alliance, $27,724; Medina Concrete Co. & E. A. Brown, Medina, O., $28,972; Phillips & Bixel, Cleveland, O., $28,071; Nitschke & Gibbons, Cleveland, $32,803; Wildes & Davison, Akron, $27,397; Tibbets & Loomis, Medina, $30,669; Jos. Winterbottom, Cleveland, $29,190. Engineers, E. G. Bradbury and G. P. Shute, of Columbus.

Frederick, Okla.—We are informed that all contracts have been let for water works and sewerage improvements, bonds for which were recently voted.

Freewater, Ore.—Chas. L. Swain, of Freewater, has secured franchise for water works; probable cost, $50,000.

Portland, Ore.—We are informed that the citizens in June voted to issue $275,000 bonds to purchase fire boat and lay water mains for fire protection on 6 blocks on both sides of Willamette River. Thos. E. Devlin, City Aud.

Ft. Adams, R. I.—Bids will be received by Capt. Willis C. Metcalf, Q. M., U. S. A., Ft. Adams, until Aug. 5 for the construction of a 400,000 gal. reservoir, 3 shelters for springs and laying pipe from springs to reservoir at Sandertown, R. I.; also laying pipe from reservoir to and across Narragansett Bay to a connection with reservoir at Ft. Greble, Dutch Island, as advertised in The Engineering Record.

Memphis, Tenn. Bids will be received until July 15 at the office of Ennis M. Douglas, City Register, for $200,000 water bonds.

Binghamton, Tenn. The citizens are reported to have voted to issue $30,000 bonds for water-works and a sewerage system.

Commerce, Tex. Bids will be received until July 18 by this city for the purchase of boilers, pumps, heaters, boiler feed pumps, deep well pumps, c. i. pipe, hydrants and valves. The O'Neil Engr. Co., Engrs., Dallas.

Graham, Tex.—The City Secy.-Treas. writes that bids will be received on Aug. 1 for water works; probable cost $15,000. Engineer, J. B. Hawley, of Ft. Worth.

Brownsville, Tex. See "Power Plants, Gas and Electricity."

Ladysmith, Wis. The City Council is reported to have decided to issue bonds for the extension of water works, also for the erection of a school.

**Items marked thus give the names of parties awarded contracts.*

Winnipeg, Man.—G. C. Whipple, of New York, N. Y., is stated to have submitted a report on water supply in which he states that if Red River is adopted as a supply it will be necessary to filter and soften the water, and recommends a mechanical filter.

SEWERAGE AND SEWAGE DISPOSAL.

Notes Arranged Alphabetically by States.

Florola, Ala.—See "Water."

San Jose, Cal.—Bids will be received until July 22 by the Bd. Co. Superv. (Henry A. Pfister, Clk.), for constructing septic tank sewer system at the County Poorhouse, near Milpitas.

Oakland, Cal.—Bids will be received until July 24 by Bd. Pub. Wks. (Walter B. Fawcett, Secy.), for constructing concrete sewers in portions of 2d, Webster and Grove Sts.

New Britain, Conn.—There will probably be one section of about 2 miles of sewer work let here this fall for sanitary and storm water purposes. W. H. Cadwell, Engr. in charge.

Waterbury, Conn.—It is reported that Wm. H. Sandland, City Clk., will receive bids until Aug. 19 for $100,000 sewer bonds.

Hartford, Conn.—Bids opened on July 8 by the Bd. of Contract and Supply for the Ann St. sewer have been rejected and new bids will be received on July 15. Three bids were received for this work as follows: Falvey & Kelley, of Boston, $19,170; F. B. & W. H. O'Neil, Hartford, $19,390, and Charles H. Slocomb, Hartford, $19,535.

Washington, D. C.—Bids will be received by the Com. D. C. until July 15, for the construction of sewers. Henry B. F. Macfarland, Comr.

The only bid received and opened on July 7 by the Comrs. D. C. for constructing sewers was submitted by the Warren F. Brenizer Co., 2d anad O Sts. S. E., at the following bid: 2,475 cu. yds. excav., $1.75; 33 cu. yds. brick masonry, $17; 28 cu. yds. vitri. masonry, $24; 60 cu. yds. concrete "B," $9; 75 cu. yds. concrete "C," $9; 305 lin. ft. 24-in. terra cotta pipe laid, $1.40, and 675 lin. ft. 6-in. terra cotta pipe drain, 30 cts.; total cost, $7,409. D. E. McComb, Supt. of Sewers.

Millen, Ga.—See "Power Plants, Gas and Electricity."

Cordele, Ga.—Bids will be received until July 22 by the Council and R. L. Wilson, Mayor, for furnishing material and constructing a system of sanitary sewers embracing about 9 miles pipe sewers, from 8 to 18 in. in diameter, 72 manholes, 25 automatic flush tanks, etc. J. B. McCrary & Co., Consulting Engrs., Atlanta. S. C. Stallings, Resident Engr., Cordele.

Benton, Ill.—The City Council is reported to have passed a resolution providing for the issue of $16,500 bonds for the construction of sewers.

Waukegan, Ill.—Bids will be received until July 19 by the Bd. of Local Improv. (Fred W. Churchill, Secy.), for constructing a system of sewers, including 200 lin. ft. 48-in. reinforced sewer, 2,400 lin. ft. 48-in., 1,300 lin. ft. 36-in., 830 lin. ft. 30-in., 2,330 lin. ft. 27-in., and 594 lin. ft. 24-in. concrete sewer; 1,375 lin. ft. 21-in., 1,230 lin. ft. 18-in., 2,740 lin. ft. 15-in., 2,285 lin. ft. 12-in. and 3,380 lin. ft. 9-in. vitrified pipe sewers, with necessary bulkhead, manholes, etc. M. R. Miller, Supt. Pub. Wks.

**Ottawa, Ill.*—Chas. F. Wilson, Public Engr., Leland Bldg., Ottawa, writes that the following are the bids opened on June 18 by the Bd. of Local Improv. for the construction of a sewerage system: (*o*) Green & Sons, 84 La Salle St., Chicago (awarded contract); (*b*) Nash Bros., 84 La Salle St., Chicago; (*c*) H. D. Hallett, Aurora.

Columbus, Ind.—W. H. Rights, City Engr., writes that new bids will be received by Lawrence Orr, City Clk., on Aug. 5 for 9,838 ft. of main and lateral sewers.

Evansville, Ind.—It is reported that bids are being asked by the Trus. of the Southern Indiana Hospital for Insane for the construction of a sewage disposal plant. C. E. Loughlin, Med. Supt.

Richmona, Ind.—Local press reports state that no bids were received on June 28 for the construction of a sewerage system, 4 miles in length, and disposal plant; new bids will be received by the Bd. of Pub. Wks. (C. W. Merrill Chmn.). Probable cost of work, $50,000. Fred. R. Charles is City Engr.

Ames, Ia.—Bids will be received until July 18 by the City Council, for constructing sanitary sewers in portions of College, Lincoln, Carroll and Kellogg Sts., requiring about 2,924 ft. 8-in. vitr. sewer pipe and 6-in. agricultural drain tile. A. B. Maxwell, City Clk.

Spencer, Ia.—Bids will be received until July 19 by the City Council for constructing sewers in portions of 2d and 3d Sts., requiring 1,756 ft. 8-in. vitr. pipe. R. L. Taylor, City Clk.

Hiawatha, Kan.—W. B. Hazen, of St. Joseph, Mo., is preparing plans and specifications for two lateral sewers in Dist. 2.

**Horton, Kan.*—T. W. Roberts, of Independence, Mo., has secured the contract for constructing 9,315 ft. of lateral sewers for Dist 1 (bids opened July 1) for about $8,312. Enginer, W. B. Hazen, of St. Joseph, Mo.

Wichita, Kan.—Plans are reported to have been completed and forwarded for approval to State Bd. of Health at Topeka, for the West Side sanitary sewer, which will cost about $80,000.

Bogalusa, La.—J. H. Randolph, of Baton Rouge, is reported to have returned from Bogalusa, where he completed design for a $150,000 sewerage system for the Great Southern Lumber Co., which is to be installed at Bogalusa.

**Brookline, Mass.*—The lowest and successful bid opened on June 28 by the Metropolitan Water and Sewer Bd. at Boston, for constructing a portion of Sec. 82, contract 57 extension of the high level sewer, South Metropolitan system, Brookline, was submitted by T. J. O'Connell, 158 Adams St., Dorchester, at the following bid: 1,350 lin. ft. earth excav. and refill in trench, 6 ft. 6-in.x7 ft. sewer, $8.75; 50 cu. yds. brick masonry (Portland) in manholes, $16; 2,000 cu. yds. concrete masonry (Portland) in trench 6 ft. 6-in.x7 ft. sewer, $8; 300 cu. yds. rock excav. in trench, $6; total, $30,412. Totals of other bids: Geo. M. Bryne Co., 7 Water St., Boston, $40,725; Falvey & Kelly, 15 Intervale Park, Dorchester, $38,925; Chas. G. Craib & Co., Winthrop, $38,475; Bruno, Salomone & Petitti, 23 Court St., Boston, $37,412; Geo. J. Regan, 92 Stoughton St., Dorchester, $37,287; Jas. Driscoll & Son, Brookline, $37,200; Jones & Meehan, 10 Tremont St., Boston, $36,100, and Coughlan & Sheils, 104 Hanover St., Boston, $30,415.

Canton, Miss.—Press reports state that bids will be received by City Council until July 16 for the construction of a sewerage system to cost about $35,000. Engineer, Walter Kirkpatrick, of Jackson, Miss. O. S. Miller, Mayor.

Trenton, N. J.—Bids will be received until July 16 by the Common Council for constructing a sewer in a portion of Home and Walter Aves., also a drain in portion of Ohio Ave. Harry B. Salter, City Clk.

The Common Council on July 2 passed ordinances providing for the construction of sewers in Hillcrest, Stuyvesant, Parkside, N. Clinton, Beechwood and Whitaker Aves.

Amsterdam, N. Y.—Bids will be received until July 17 by the Sewer Comrs. (Almarin T. Young, Secy.) for furnishing material and constructing a 15-in. storm sewer in a portion of Chestnut St.

Troy, N. Y.—Bids will be received until July 19 by Bd. Contract & Supply (Jas. M. Riley, Clk.) for furnishing material and constructing 665 ft. of 20-in. salt-glazed vitr. pipe sewer in Defreest Ave., including 4 manholes, 4 catch-basins and 216 ft. 6-in. laterals; also 650 ft. 8-in. salt-glazed vitrified pipe sewer in 2 alleys, including 240 ft. 6-in. laterals and 3 manholes.

Henderson, N. C.—It is reported tha bids will be received until July 24 by Henry T. Powell, City Clk., for constructing an extension to the sewer system.

Wahpeton, N. D.—Wm. R. Purdon, City Aud., writes that the proposed sewers to be constructed in Dist. 4 will cost about $7,000. Engineer, Saml. Crabbe, of Fargo.

**Lebanon, O.*—M. E. Gustin, Village Clk., writes that the contract for constructing sanitary sewers (bids opened July 1) has been awarded to Gough & Co., of Muncie, Ind., for $10,182.

Youngstown, O.—Bids will be received until July 19 by the Bd. Pub. Service (W. H. McMillin, Clk.), for furnishing material and constructing a sewer in a portion of Summit St. and a portion of E. Federal St.

Bucyrus, O.—It is stated that bids will be received until July 19 by Chas. Meyer, Clk. Bd. Infirmary Dirs., for constructing a sewage disposal plant.

New Bremen, O.—Bids will be received by A. M. Steinebrey, Village Clk., until Aug. 3 for about 16,000 sq. yds. paving, etc., on different streets; also for about 3,000 ft. of sanitary sewers, as advertised in The Engineering Record.

Medina, O.—It is reported that bids will be received until July 22 by O. O. Van Deusen, Village Clk., for $23,000 general sewer bonds.

Bids will be received until July 16 by the Village Council for constructing sewers and sewage disposal works, as advertised in The Engineering Record. O. O. Van Deusen, Village Clk.

Brooklyn, N. Y.—The following are the bids opened on June 12 by Bird S. Coler, Pres. Brooklyn Boro., for constructing Sect. 1, Div. 2, of Gold St. sewer system: (*a*) John J. Creem, (*b*) Jenks & Asserson Constr. Co., (*c*) Borough Constr. Co. (bidders all of Brooklyn):

Totals	$604,259	$640,365	$623,799

St. Paul, Minn.—It is stated that bids will be received until July 17 by Louis Betz, City Compt., for $150,000 sewer bonds and $50,000 park bonds.

Virginia, Minn.—Bids will be received by Albert E. Bickford, City Clk., until July 23 for constructing sewers in Dists. Nos. 3E, 2, 3D and 3C.

Kansas City, Mo.—Bids will be received until July 18 by the Bd. of Pub. Wks., for furnishing material and constructing sewers in Sewer District No. 297. E. A. Harper, City Engr.

Aurora, Neb.—The City Council is reported to have directed H. C. Gardner, of Lincoln, to prepare plans for a sewerage system, estimated to cost $10,000.

Plainfield, N. J.—Bids will be received by Common Council until Aug. 5 for the construction of sanitary sewers, also same time and place for storm sewers; both proposals advertised in The Engineering Record. Jas. T. MacMurray, City Clk. Andrew J. Gavett, City Surveyor.

Orange, N. J.—All bids opened on July 1 for constructing concrete storm sewer in the east branch of Rahway River are stated to have been rejected, being considered too high. It was decided to procure new bids, a timber flume being substituted for the concrete.

Newark, N. J.—Bids will be received until July 18 by Bd. Street & Water Comrs. (Morris R. Sherrerd, Ch. Engr.), for constructing Meadow Brook sewer system Sect. 1. The following is about the amount of work to be done: 3,970 ft. of 18-in., double strength pipe sewer, and 320 ft. of 12-in., 2,370 ft. of 10-in., and 7,120 ft. of 8-in., deep and wide socket pipe sewer; 18,500 ft. of 6-in. vitr. pipe house connections, 850 ft. of 6-in. iron pipe house connections, 1,250 ft. of 8-in. iron pipe, 3,000 ft. of 8-in. underdrain, 68 manholes complete, including 17 junction and chimney manholes, 2 flush tanks complete, 200 cu. yds. excav. for brook, pumping station complete.

Salem, O.—Bids will be received by the Bd. of Pub. Service until July 17 for furnishing material and constructing a trunk line sewer as advertised in The Engineering Record.

**Delphos, O.*—The contract for building new sewer system (bids opened June 21) is reported to have been awarded to Paul & Kerschner, of Dayton. H. Ricker & Sons, of Delphos, secured contract for furnishing the tiles.

**Youngstown, O.*—Jas. Kane is reported to have secured contracts for constructing sewers in Caldwell, Manning and Wells Sts. of the Riverview Sect., No. 1, for $17,200, and for sewers in Belle Ave., Central, Parkwood and Manning Aves. and Crescent St., Riverview Sect., No. 2, for $7,180.

Frederick, Okla.—See "Water."

Harrisburg, Pa.—The following are reported to be the bids opened on July 5 by the Bd. of Pub. Wks. for constructing Mish Hollow sewer: Henry Opperman, Harrisburg, $36,344; Geo. B. Stucker, $38,189; Brady & Snavely, $39,203, and Thos. B. Bryson, New York, N. Y., $48,077.

Greenville, Pa.—We are informed that new bids will be received by J. M. Hittle, Boro. Secy., until July 16 for constructing about 468 ft. 18 in. and 1,793 ft. of 20-in. terminal sewer and about 2.8 miles of sanitary sewers, 8, 10, 12, 18 and 20-in. diam.

Allentown, Pa.—The City Council is reported to have passed an ordinance providing for the issue of $118,000 bonds to be used for sewers, paving, the purchase of a park site and for fire department purposes.

McKees Rocks, Pa.—Bids will be received until July 16 by J. P. Gillen, Boro. Clk., for constructing sewers in Camp St. and Thomson Ave. of terra cotta (double strength) pipe; block stone or brick paving on Thom-

* *Items marked thus give the names of parties awarded contracts.*

[illegible] Ave., brick paving on Bell Ave. and Gillen alley; grading, curbing and brick paving on Grove, Greydon and [illegible] Sts. S. L. Gardner, Boro. Engr., Chartiers and [illegible] Sts.

Philadelphia, Pa.—The Subcommittee reports apportioning the new loan of $1,000,000 for main sewer extension in about 28 streets were recommended by Councils' Com. on June 26. Included among the more important items is the extension of the Wissahickon low level intercepting sewer through Fairmount Park to Walnut lane, and the Wissahickon high-level cut-off in Stickley St., Hunting Park Ave. and Bristol St.

Bids will be received by Geo. R. Stearns, Dir. Dept. Pub. Wks., until July 22, for construction of sewers appurtenant to abolishment of grade crossings along line of the Phila., Germantown & Norristown R. R. and Richmond branch of Phila. & Reading Ry. Contracts 101 to 107 inclusive, as advertised in The Engineering Record. Cost reported to be about $250,000.

**Dunmore (Scranton), Pa.*—Spruks Bros., 518 Alder St., Scranton, is reported to have secured contracts for constructing sewers in the 3d and 6th Wards at $14,300 and $24,000 respectively.

BRIDGES.

Notes Arranged Alphabetically by States.

Woodland, Cal.—Bids will be received until Aug. 1 at Woodland and Fairfield by the Clks. of Yolo and Solano Counties, for constructing a reinforced concrete bridge across Putah Creek, consisting of three 115-ft. spans. C. F. Hadsall, Clk. Yolo County, Woodland.

San Jose, Cal.—Bids will be received until July 22 by the Bd. of Superv. at San Jose for constructing a concrete bridge over Wildcat Creek at Fruitvale Ave. Henry A. Pfister, Co. Clk.

**Jacksonville, Fla.*—J. W. Richards, Dyal-Upchurch Bldg., Jacksonville, Engr., Atlantic & East Coast Terminal So., writes under date of July 2, that the contract for erection of plate girder bridge, approximately 107-ft. span, has been awarded to the Virginia Bridge Co., Atlanta, Ga., and contract for the erection of freight and office buildings in this city, has been awarded to W. P. Richardson & Co., of Jacksonville, Fla.

Rome, Ga.—It is stated that bids will be received by the Bd. of Co. Comrs. (J. F. Hillyer, Clk.) until Aug. 5, for constructing 60-ft. span steel truss bridge across Silver Creek.

**New Brighton, S. I., N. Y.*—The following are the bids opened June 18 at the office of Geo. Cromwell, Pres. Richmond Boro. for constructing sewers in Tompkins Ave., Sewer Dist. No. 1D, in 1st Ward: (*a*) John F. Clancy, 408 Bway., Long Island City (awarded contract); (*b*) Murphy Bros., 25th Ave. and Cropsey Ave., Brooklyn; (*c*) John E. Donovan, Port Richmond; and (*d*) Jos. Johnson's Sons, Bway., West New Brighton.

Providence, R. I.—W. F. Slade, Comr. of Pub. Wks., is reported to have authorized preliminary work to be started for the $60,000 improvement at Field's Point in connection with the precipitation plant, at which the city's sewage is treated.

Woonsocket, R. I.—Bids will be received by the Bd. of Sewer Comrs. until July 18 for about 1,500 ft. 8-in. sanitary sewer and about 600 cu. yds. rock excav., as advertised in The Engineering Record. Frank H. Mills, City Engr.

Covington, Tenn.—It is reported that bids will be received until July 22 by F. R. Fisher, Town Recorder, for $15,000 sewer bonds.

Binghamton, Tenn.—See "Water."

Chattanooga, Tenn.—The two lowest bids opened on July 2 by the Bd. of Pub. Wks. for constructing sewers in Dists. 7 and 9 were submitted by T. J. Shea, of New Orleans, for about $84,500, and Guild & Co., of Chattanooga, at about $88,750.

Houston, Tex.—The City Engr. is reported to have been authorized to prepare plans and specifications for the drainage of streets crossed by the several railways of the city preliminary to the remedying of the drainage of the entire city including the construction of two large storm sewers.

Beaumont, Tex.—Local press reports state that the Council on July 2 rejected bids recently received for the construction of sewers, and the work will be done under supervision of the City Engr.; estimated cost, $64,580.

Bonham, Tex.—Plans and estimates are reported as being prepared for the construction of a sewerage system.

Aberdeen, Wash.—Bids will be received until July 24 by P. F. Clark, City Clk., for constructing sewers in Sewer Dists. C and D, to consist of about 5 miles vitrified clay pipe sewers, from 6 to 24-in., with lampholes, Y's, etc.; manholes to be of concrete; flush tanks to be of concrete, with the Miller automatic system. H. W. [illegible]tman, City Engr.

[illegible] Wash.—See "Paving and Roadmaking."

[illegible], B. [illegible]—See "Paving and Roadmaking."

Racine, Wis.—It is stated that bids will be received [illegible] by the City Clk. for rebuilding and lowering sewer [illegible] of Washington Ave. P. H. Conroy, Chmn. Bd. Pub. Wks.

Milwaukee, Wis.—Bids will be received until July 16 by Bd. Pub. Wks. (Chas. J. Poetsch, Chmn.) for constructing brick and pipe sewers in West Sewerage Dist.

Watertown, Wis.—E. B. Parsons, City Engr., writes that bids are wanted until July [illegible] for the construction of a sewerage system, to cost about [illegible].

**Platteville, Wis.*—Robt. Nelson, of Racine, has secured the contract for constructing sewers (bids opened June 28), at the following bids: 2,610 ft. [illegible]-in. pipe, 85 cts.; 2,440 ft. 10-in. pipe, [illegible]; [illegible] ft. 8-in. pipe, 75 cts.; 1,340 ft. 6-in. pipe, [illegible] manholes, ea. $33; 2 flush tanks, ea. $7[illegible]; [illegible] ft. [illegible]-in. c. i. pipe, $[illegible]; [illegible] ft. 12-in. c. i. pipe, $[illegible], and [illegible] cu. yds. [illegible] excav., $5 cu. yd. J. C. Hughes & Co., of [illegible], secured the contract for the septic tank at [illegible].

Elberton, Ga.—It is reported that bids will be received by the Comrs. of Elbert and Wilkes Counties until July 27 for constructing steel bridge across Broad River at Bells Ferry. (Elberton, C. H. of Elbert County.)

Caldwell, Idaho.—The City Council is reported to be considering the building of 2 bridges over the Indian Creek, on Bank and Kimble Aves. The bridges will be of concrete and iron and will involve an expenditure of $15,000.

Ottawa, Ill.—The McKinley syndicate and the city of Ottawa are reported to be considering the construction of a bridge over Illinois River, to cost about $125,000.

Wichita, Kan.—It is stated that bids will be received until July 29 by the Bd. Co. Comrs. at the office of Claude N. Cartwright, Co. Clk., Wichita, for furnishing material and constructing a reinforced concrete bridge over Arkansas River at Douglas Ave., Wichita.

Williamsport, Md.—On application of the Washington & Berkeley Bridge Co. the Bd. of County Comrs. are stated to have granted permission to the company to erect a toll bridge across the Potomac River. The bridge will cost about $75,000.

Pittsfield, Mass.—We are informed that it is proposed to build a concrete bridge over outlet near Pontoosuc Lake dam to cost about $5,000. Engineer, Arthur B. Farnham, of Pittsfield.

Bids will be received until July 17 by the Bd. Pub. Wks. (Louis B. Cummings, Clk.), for constructing a concrete arch bridge across Housatonic River at Mill St.

Boston, Mass.—The Bd. of Aldermen on July 1 passed the bill providing for a loan of $60,000 to the Bridge Dept. for the reconstruction of Mt. Washington Ave. bridge.

**Grand Rapids, Mich.*—L. W. Anderson, City Engr., writes that the following are the bids opened on June 20 for constructing superstructure of steel bridge over Grand River at Ann St.: Elkhart Bridge & Iron Co., Elkhart, Ind., $40,000; Capital Constr. Co., Columbus, Ohio, $38,750; Attica Bridge Co., Attica, Ind., $40,995; Penn Bridge Co., Beaver Falls, Pa., $40,838; Groton Bridge Co., Owosso, Mich., $44,250; Toledo, Massillon Bridge Co., Toledo, Ohio, $39,300; Cowing Eng. Co., Cleveland, Ohio, $41,790; and Joliet Bridge Iron Co., Joliet, Ill., $36,500 (awarded contract). Date of completion Dec. 20, 1907.

Hattiesburg, Miss.—Separate bids will be received until July 31, at the office of the City Clk., for the construction of 4 steel highway bridge over Gordon's Creek, spans to range from about 65 to 75 ft., to be of plate girder type, 30 ft. wide. J. H. Putnam, City Engr.

**Reno, Nev.*—W. A. Fogg, Co. Clk., writes that the contract for constructing the superstructures of two steel bridges across Truckee River (bids opened June 24) has been awarded to Mervy-Elwell Co., of San Francisco, Cal., for $8,250.

Hackensack, N. J.—Bids will be received until July 16 by the Finance Com. of the Bd. of Chosen Freeholders, at Hackensack (Adolph Kruger, Chmn.), for $80,000 bonds issued to construct a bridge from Court St., Hackensack, to Court St., Bogota; also, same date, for $18,000 bonds to construct a bridge across the Passaic River to replace Wagaraw Bridge.

New York, N. Y.—The following are the bids opened on July 2 by Jas. W. Stevenson, Comr. of Bridges, for cutting recesses and wells for additional anchorage in West and East Anchor Piers of Blackwell's Island Bridge over East River, bet. Borough of Manhattan and Queens: Haggerty Cont. Co., 215 W. 125th St., $14,921; Williams Eng. & Const. Co., 13 Park Row, $5,205; and Snare & Triest Co., 143 Liberty St., $24,440.

Trenton, N. J.—The Board of Freeholders is stated to have decided to rebuild the bridge over the Assunpink Creek at Whitehead's Mills. The repairs will consist of steel and concrete superstructure and a complete concrete floor. The floor, piers and abuttments will be extended in order to make the bridge 20 ft. wide.

New York, N. Y.—Bids will be received until July 23 by Jas. W. Stevenson, Comr. Bridges, New York City, for making test borings at the site of a new bridge over the East River, between the Boroughs of Manhattan and Brooklyn; also, same date and place, for the construction of trolley railway approaches to the Brooklyn Bridge, in the Boro. of Brooklyn; also, same time and place, for removing columns at Sands and Washington Sts., in the Boro. of Brooklyn, Brooklyn Bridge.

Columbus, O.—Bids will be received until Aug. 5 by the Co. Comrs. for furnishing material and doing the following work: Eng. estimate No. 753. Constructing the approaches, etc., to the Chillicothe pike bridge over Big Walnut Creek in Hamilton township; Eng. estimate No. 779. Superstructure. Eng. estimate No. 780. Substructure of the Pegg bridge on west side of Olentangy River, Clinton township. Plans "A." Eng. estimate No. 781. Superstructure of the Pegg bridge. Plan "B." Eng. estimate No. 782. Substructure of the Pegg bridge. Plans "B." Eng. estimate No. 783. Reinforced concrete arch bridge, Luten's patent for the Pegg bridge. Plans "C." W. C. Cussins, Co. Aud.

*The County Comrs. are stated to have opened bids June 24 and awarded contracts as follows: For constructing substructure of Leonard Ave. viaduct in Hamilton Township to J. A. Tebingle for $20,819; sidewalks and concrete work to Schilling Bros. for $12,863; repairing roadway leading to viaduct to Geigle & Garnes for $8,908.

Cleveland, O.—Bids were opened on June 24 by the Bd. of Pub. Service for the Eagle Ave. S. W. Bridge: *Substructure*—Lowest bidder, Jos. Duff Constr. Co.: Removal of old structure, $1,500; 2,000 cu. yds. excav., $1.25; 16,000 ft. foundation piles, 22 cts.; 2,400 cu. yds. concrete 1:3:6 Portland cement, $6.50; 80 cu. yds. stone coping, 15 cts.; and 3,000 cu. yds. grading, 20 cts.; total, $24,920. Totals of other bids: Wm. Kupper, $25,300; Hanahan & King, $26,730; C. H. Fath & Son Constr. Co., $27,900; Northern Ohio Paving & Constr. Co., $28,400; Carland & Hecker, $28,540; Concrete Steel Constr. Co., $28,680; Hunkin Bros. Constr. Co., $28,712; Alex. Tuhman, $32,010; L. Garrett, Kent, O., $37,070 (bidders of Cleveland, unless otherwise mentioned).

Superstructure—(*a*) 130 tons steel and iron, per ton; (*o*) totals: Interstate Eng. Co., Bedford, O., *a* $86, *b* $11,180; King Bridge Co., Cleveland, O., *a* $94, *b* $12,220.

Chardon, O.—Bids will be received until July 29 by the Comrs. of Geaugh and Cuyahoga Counties, at Chardon, for furnishing material and constructing and repairing several bridges and the abutments at the iron bridge on Bainbridge Road. Julius C. Dorn, Clk. Co. Comrs.

Mt. Gilead, O.—It is reported that bids will be received until July 16 for construction of superstructure of steel bridge over Whetstone Creek, Washington Township. W. C. McFarland, Co. Aud.

St. Clairsville, O.—Bids will be received by A. W. Beatty, Co. Aud., until July 22, for superstructure, substructure and concrete culverts for county bridges, according to reports.

Sandusky, O.—It is stated that bids will be received by the Board of Commissioners of Erie County until July 16 for substructure and superstructure of a bridge over Mills Creek, on Monroe St. Chas. Kubach, Co. Aud.

New Winchester, O.—It is stated that bids will be received until July 17 by H. N. Oberlander, Chmn. Bd. Co. Comrs., for constructing an iron bridge near New Winchester. J. I. Smith, Co. Aud.

Cleveland, O.—Bids will be received until July 27 by the Bd. Co. Comrs. (Julius C. Dorn, Clk.) for constructing a concrete steel culvert, Chagrin Falls Township, per report No. 1503.

Philadelphia, Pa.—Councils' Com. on Surveys on June 26 approved ordinances providing for new bridges in different parts of the city. The full list of new bridges to be built and old ones to be repaired is as follows: Widening Chestnut St. Bridge over Schuylkill River, raising approaches and building a bridge over 30th St., $290,000; Belmont and Girard Ave., over Pennsylvania R. R., $85,000; Columbia Ave., over Connecting Ry., $54,100; Wyoming Ave., over Frankford Creek, $140,000; 12th St., under Connecting Ry., $70,000; to widen Chestnut St. Bridge, raise approaches and build bridge over 30th St., $290,000; Belfield Ave., under Tabor branch Phila. & Reading Ry., $50,000; Large St., under Frankford branch Phila. & Reading Ry., $40,000; 29th St. and Montgomery Ave., over Connecting Ry., $82,000; 66th Ave., North, over North Penn Ry., $26,000; Woodland Ave., over Cobb's Creek, inter-county bridge, $36,000; 54th St., over Philadelphia, Baltimore & Washington R. R., $44,000; Ontario St., under Richmond branch Phila. & Reading Ry., $40,000; Montgomery Ave., over Connecting Ry., $64,000; Roberts Ave., over Connecting Ry., $40,000; 61st St., over Baltimore & Ohio R. R., $25,000; 62d St., over Phila., Washington & Baltimore R. R., $50,500. Of the total bridge cost the city will bear $1,000,000, the railroads concerned assuming the remainder. Most of the bridges will be entirely new, connecting districts that have hitherto had no direct means of communication with each other.

Newcastle, Pa.—Bids will be received until July 16 by the Co. Comrs. (John F. Pitts, Chmn.), at New Castle, for constructing the following bridges: 2-span steel bridge over Slippery Rock Creek, in Slippery Rock Township; 1-span superstructure of reinforced concrete bridge over Jameson's Run, Plaingrove Township; 1-span superstructure of reinforced concrete bridge over Brush Run, in Slippery Rock Township; 1-span steel superstructure with concrete substructure over Little Beaver Creek, in Little Beaver Township; concrete arch in North Beaver Township over Chamber's Run; 1-span reinforced concrete over Potter's Run, in Washington Township; 1-span reinforced concrete in Wayne Township, village of Wurtemburg.

*Items marked thus give the names of parties awarded contracts.

Kittanning, Pa.—It is stated that bids will be received by the Co. Comrs. (Benj. Oswald, Clk.) until July 18, for masonry work in connection with bridges over Sugar and Pine Creeks.

Wheatland, Pa.—The City Council is stated to have passed an ordinance giving the Shenango Iron & Steel Co. the right to build a steel bridge over Council Ave.

Wilkesbarre, Pa.—Bids will be received until July 18 by Jas. M. Norris, Co. Compt., Wilkesbarre, for repairing and reconstructing bridge over Mill Creek on Mock St. in Miners Mills Boro.

Easton, Pa.—At a joint meeting of the Comrs. of Northampton and Lehigh Counties on June 28 it was decided to build a reinforced concrete bridge over Monocasy Creek bet. Bethlehem and West Bethlehem; it will be 60 ft. wide, having 2 sidewalks 8 ft. in width and 2 trolley tracks in center. L. A. Francisco, of Easton, and the County Engineer of Lehigh, R. S. Rathbun, of Allentown, were ordered to prepare plans and specifications for the bridge as soon as possible, and present them to the two Boards of Comrs. for approval. The structure will be about 460 ft. long and 67 ft. from water level to roadway. In all probability 5 arches of about 80 ft. span will be used. The cost will be from $90,000 to $100,000. When the plans are approved the contract will be let by Northampton County, at Easton.

Harrisburg, Pa.—The following are the bids opened on July 5 by the Bd. of Pub. Wks. for the reconstruction of Mulberry St. bridge of reinforced concrete: McCormick & Co., Philadelphia, $260,046; Coder & Miller, Harrisburg, $299,486, anad Scofield Co., Philadelphia, $475,558.

Nasonville, R. I.—Bids will be received until July 18 by Seagrave & Lincoln, Engrs, 35 Commercial Bldg., Woonsocket, for constructing a stone arch bridge over Branch River at Nasonville. Wm. Orrell, Chmn. Com., Burrillville.

Memphis, Tenn.—Bids will be received until July 16 by Ennis M. Douglass, City Register, for constructing a reinforced concrete deck for the Madison Ave. bridge over Bayou Gayoso. The deck is about 40x66 ft. and will contain approximately 200 cu. yds. concrete and 20,000 lbs. of steel reinforcements.

**Bryan, Tex.*—The Commissioners Court is reported to have awarded the contract for building the iron bridge across the Brazos River at Koppe's Ferry to the Missouri Valley Bridge Co., of Kansas City, for $17,190.

Columbus, Ga.—Engineers in the employ of the Columbus Power Co. are reported to be completing survey of the water power along Chattahoochie River bet. Columbus and West Point, a distance of about 34 miles. The company now has two power plants in operation and is prepared to build another plant.

Swansea, Ill.—Bids will be received by Otto J. Keller, Village Clk., until July 16 for the construction of a complete electric light plant.

Franklin, Ind.—The Franklin Water, Light & Power Co. (J. B. Rogers, Mgr.) expects to get a new franchise in July, when the plant will be remodeled and the following new equipment installed: A new engine direct connected to a 250-kw., 3-phase alternator, a new 125-kw., 3-phase alternator to take place of present machine and belted to the engine already installed. One 75-light transformer to take place of direct-current arc machine, when all arc lamps will be changed to alternating-current series enclosed lamps.

Tulsa, Ind. Ter.—The Tulsa Electric Light Co. is reported incorporated with a capital of $15,000 by P. D. Campbell, and D. N. Martindale, of Tulsa, and H. F. Burt, of Oklahoma City, Okla.

Boston, Mass.—Bids will be received until July 16 by the Trus. of the Boston City Hospital (Geo. M. Rowe, Supt.) for electric wiring the East Boston Relief Station on Porter St., East Boston.

Springfield, Mass.—The Springfield Gas Light Co. has petitioned the State Gas and Electric Light Comm. for authority to issue $350,000 of new stock to pay floating debt, for new construction, extensions, permanent improvements, including extensions of mains, the acquisition of land, purifying house, purifying apparatus, and other purposes.

Marlboro, Mass.—The Marlboro Electric Light Co. is reported to have petitioned the Bd. of Gas and Electric Light Comrs. for permission to issue of additional capital to the amount of $170,000; the proceeds to be used for paving funded and floating debt and for permanent improvements.

Kalamazoo, Mich.—Frank W. Armstrong, of Chicago, Ill., is reported interested in the establishment of a heating and power plant in this city for furnishing power to the manufacturing industries of Kalamazoo.

Midland, Mich.—Surveys are being made by H. von Schon, Wayne County Bank Bldg., Detroit, of the Chippewa River, for the purpose of several power developments.

Maitland, Mo.—The power plant of the Maitland Electric Light & Power Co. is reported to have been destroyed by fire; loss about $10,000.

Newark, N. J.—Bids will be received until July 16 by the Com. on Repairs, Heating and Sanitation of the Bd. of Educ. (R. D. Argue, Secy.), for furnishing material and installing an electric lighting apparatus in the S. 8th St. School. Runyon & Carey, 122 Market St., are the engrs.

Morristown, N. J.—The Bd. of Aldermen on July 5 granted a 50-yr. franchise to the new Morris & Somerset Electric Co.

Blackwell's Island, N. Y.—Bids will be received until July 18 by Robt. W. Hebberd, Comr. of Pub. Charities, N. Y. City, for materials and labor required for complete conduiting, electric wiring, and all other work in connection with the installation of a complete electric lighting and power system for buildings and grounds under jurisdiction of Dept. of Pub. Charities, and comprising the Metropolitan Hospital, Dist. Blackwell's Island, Boro. of Manhattan.

Oswego, N. Y.—The citizens are reported to have voted on June 27 to purchase the property of the Country Club upon which to erect a power house in connection with relocation of high dam; the new power house will cost about $75,000.

Spray, N. C.—The Rhode Island Co. of Spray, is reported to have decided to purchase some new machinery and equipment.

Toledo, O.—New bids will be received until July 26 by the Co. Aud. separately or as a whole for all labor and material required in the building of a heating and power house, including stack for same, at the Lucas County Infirmary; also at the same time for installing in the heating and power house, boilers, dynamos, machinery and appurtenances; conduits and piping outside of said power house; probable cost, $27,000. Edwd. Bayer, archt., 1630 the Nicholas Bldg.; J. W. Kerr, Chmn. Co. Comrs.

Mosquite, Ore.—See "Water."

Wilmerding, Pa.—W. J. Hally, of Wilmerding; Philip Geiss, of East Pittsburg, and Henry Harris, of Braddock, will, it is reported, shortly apply for charters for 3 new electric lighting companies to be known respectively as the Braddock, the East Pittsburg, and the North Braddock electric light companies. They intend to work in connection with the United Electric Light Co., of Wilmerding.

Columbia, S. C.—It is reported that the Savannah River Power Co. (H. A. Orr, Pres.), capitaliized at $8,500,000, will develop during the summer the Calhoun Falls property with 35,000 h. p. Cherokee falls, also on the Savannah, 10,000 h. p. Hatton shoals, on the Tugaloo River; Broad River, in Georgia, at Anthony falls, near Elberton, 10,000 h. p., and at Gregg Shoals about 8,000 h. p.

Anderson, S. C.—Hugh McRae, of Wilmington, N. C., is reported to be completing arrangements for the development of Cherokee Falls, 4 miles below Gregg Shoals on Savannah River. Work on the dam, which will commence at once, will furnish 10,000 h. p. The new company will be known as the Calhoun Falls Power Co., and will have a capital of $8,500,000.

Sioux Falls, S. D.—H. M. Byllessby & Co., of Chicago, Ill., are reported to have been retained to make plans for the reconstruction and extension of existing hydraulic plants of the Sioux Fall Light & Power Co. About $15,000 will be expended in rebuilding the present dams and in adding new euipment.

Lawrenceburg, Tenn.—Walter G. Kirkpatrick, of Jackson, Miss., is making plans for municipal power plant comprising concrete dam, turbines, transmission and distribution lines, arc lamps, dynamos, electric pumping, steel tower and tank, water mains; approximately 200 h.p.

Waco, Tex.—The City Council is reported to have granted Jos. J. Henry a franchise for the construction of an electric light and power plant.

Brownsville, Tex.—An election will probably soon be held to vote on issuing $70,000 bonds for water works and an electric light plant. Engineer, W. P. Bullock, of Kansas City, Mo.

**Richmond, Va.*—The contract for laying street mains for gas is reported to have been awarded to R. D. Wood & Co., of Philadelphia, Pa., for $31,230.

Washburn, Wis.—The Council is reported to have authorized the Lighting Com. to purchase the outside electrical equipment and business of the Washburn Electric Light & Power Co. The city has in contemplation the erection of a dam on Sioux River, 2 miles east of city, from which power will be generated to light the city.

Kamloops, B. C.—The City Clk. writes that this ciity expects to enlarge the electric light plant and is making inquiries in regard to producer gas plants.

Hamilton, Ont.—The Lighting Com. of the Bd. of Works is reported to have decided to receive bids until about Aug. 1 for street lighting; also to get prices on gas lighting.

**Items marked thus give the names of parties awarded contracts.*

ELECTRIC RAILWAYS.

Notes Arranged Alphabetically by States.

Quincy, Ill.—Plans for an interurban system of roads with Quincy as the center, took form some days ago in the incorporation of the Quincy Interurban Co., with a capital of $25,000. The first line to be built will run from Quincy to Hamilton to the north, and Pearl on the south. Directors, Henry F. Dayton, J. Henry Bastert, Ezra Best and others.

Evansville, Ind.—It is stated that Evansviille Ry. Co., incorporated recently, with a capital stock of $1,000,000, marks the consolidation of the Evansville, Rockport & Eastern Ry. Co. with the Evansville & Mt. Vernon Ry. Co. The line will be extended to Cannelton, and it is proposed eventually to build through to Louisville.

Davenport, Ia.—The American Motor Car Interurban Ry. Co. is reported incorporated, with $5,000,000 capital, to build from Waterloo to Davenport or Muscatine. Self-propelled cars will be used. The headquarters of the company will be at Marion, Ia.

Burlington, Ia.—The Burlington & Bonaparte Interurban Electric Ry. Co., is stated to have filed articles of incorporation with the Secretary of State. Capital, $10,000. The company is to construct equipment and operation an electric railway from Burlington via West Point to Bonaparte. The company is also to have the right to furnish power and lights. J. A. Johnson, of Bonaparte, Pres.; H. H. Meeke, of Bonaparte, Treas.; Ed. E. Egan, of Burlington, Sec. The line will be about 38 miles in length.

Red Fork, Ind. Ter.—The Sequoyah Park Co. is reported organized for the purpose of building an electric line and improving Sequoyah Park. It is said that $100,000 will be expended for improvements and electric lines. The road will be 11 miles in length.

**Baltimore, Md.*—Right of way for an electriic line between Baltimore and Halethorpe to be built by the Baltimore. Halethorpe & Elkridge Ry. Co., is reported to have been secured. The line will connect with the United Railways & Electric Co. and will be built within a short time. Capital $100,000.

Boston, Mass.—Bids will be received until July 18 by the Boston Transit Comn. (B. Leighton Beal, Secy.) for constructing entrances and exits at Winter St. for the Washington St. tunnel.

St. Louis, Mo.—Plans for the extension of the McKinley Electric Interurban Ry. System directly east from St. Louis through Illinois, touching at Effingham and Vandalia, Ill., and toward Sullivan, Ind., are reported under consideration. Whether this extension will be made will depend largely on the terms upon which a right of way can be obtained.

Omaha, Neb.—It is reported that over $2,000,000 will be expended this fall and next summer on the Omaha, Beatrice & Lincoln Interurban Ry. by Eastern capitalists, who have just promised to finance the project and push to completion the 55 miles of road between Omaha and Lincoln. The headquarters of the company will be in Omaha. Part of the line is already completed between Omaha and Sarpy Mills, as well as some of the roadbed east from Lincoln.

New York, N. Y.—It has been announced that the New York City Ry. Co. (M. G. Starret, Ch. Engr., 621 Bway.) intends to electrify the old Belt Line car system in First Ave.

New York, N. Y.—See "Bridges."

Ossining, N. Y.—It is stated that the Hudson River & Eastern Traction Co., which is to build an electric railway to connect Peekskill, Ossining and other towns along the Hudson with White Plains, won a victory at a special term of the Supreme Court at Nyack by the dissolution of the injunction obtained some time ago by the Westchester Traction Co., which operated the street railway system of Ossining until its equipment became so delapidated that by an order of the State Railroad Comrs., it was shut down. The new company recently gave a mortgage for $1,000,000 to the Colonial Trust Co. and will now proceed with construction. The road will first be completed in Ossining and then extended to Briar Cliff Manor, Pleasantville, Sherman Park, North White Plains and White Plains.

Phelps, N. Y.—It is reported that the Geneva, Phelps & Newark Electric Road Co., which applied to the town officials about a year ago for a franchise to construct an electric road, and which application was granted with the understanding that the road was to be in operation within two years, is reported to have sold the franchises to the J. G. White Constr. Co., now engaged in building the Rochester, Eastern & Syracuse Road. It is also said that a spur will be built from here to Clifton Springs, and in confirmation of this report a corps of surveyors began work on the line from here to Clifton Springs. It is further stated that work will be commenced on the line from Geneva via Phelps to Newark as soon as the White Constr. Co. completes the Rochester, Syracuse & Eastern as far as Clyde.

Norwich, N. Y.—It is stated that the Chenango Valley Electric Ry. Co. will make application for a franchise to build and operate an electric railway over the same route as asked by the Utica Southern R. R. The Chenango Valley Co. will also ask for the right to lay tracks through Cortland and Canasawacta Sts. Edw. L. Smith, of Towanda, Pa., Pres.; H. C. Stratton, of Oxford, Treas., and J. J. Bixby, Norwich, Secy.

Riverhead, N. Y.—The State Board of R. R. Comrs. is stated to have granted a certificate of necessity to the Suffolk Traction Co., proposing to build a street surface railroad in the county of Suffolk. The length of the road is 27.6 miles, and its termini are the point where Beaver Dam Creek intersects the South Country road in Brookhaven on the east, and the intersection of Deer Park Ave. with the South County road, or Main St. in Babylon, on the west. Capital, $1,200,000.

Utica, N. Y.—A certificate of extensions of the route of the Utica & Mohawk Valley Ry. Co. (C. Loomis Allen, Gen. Mgr.), is stated to have been filed with the County Clerk. The proposed extensions are as follows: an extension or branch consisting of a second track, beginning on Whitesboro St. at the westerly line of the city of Utica and extending westerly along Whitesboro St. An extension consisting of a single track line extending from Deerfield corners westerly along, in and upon the Marcy Road to the so-called Seymour Road. An extension consisting of a single track line from Deerfield Corners along, in and upon the Trenton Road or North Genesee St. to the reservoir. An extension consisting of a second track extending from Deerfield Corners on No. Genesee St. southerly in, along and upon No. Genesee St. to the old channel of the Mohawk River. Provision is also made for the necessary connections, curves and cross-overs for the convenient working of said lines.

Rome, N. Y.—The Rome City Ry. Co. (C. L. Allen, Gen. Mgr., Utica) is stated to have voted to increase its capital from $150,000 to $500,000. A small part of this increase will be used to pay for improvements recently made and the balance will be held in the treasury to pay for extensions that are contemplated.

Buffalo, N. Y.—The Buffalo & Lake Erie Traction Co. is stated to have been granted the right to cross Roberts road in Dunkirk, through Cassety woods and private right of way to Railroad Ave. and connect with the belt line. This practically completes the connecting link from Buffalo to Dunkirk.

The Buffalo, Genesee & Rochester Ry. Co. is stated to have been granted permission by the State Railroad Comn. to lay a double-track electric line between Buffalo and Rochester. The company is authorized to issue a mortgage for $5,000,000. Capital, $7,500,000. Attorney Herbert P. Bissell and a number of other Buffalo business men are interested.

Columbus, O.—The Defiance, Hicksville & Ft. Wayne Ry. Co. is reported incorporated, with a capital of $10,000, by W. E. Golding, H. C. Eplert, M. O. Topliff, E. A. Murphy and M. I. Brown.

Napoleon, O.—It is stated that the Lake Erie, Bowling Green & Napoleon Electric Ry. (E. H. McKnight, Gen. Mgr., Bowling Green) is to be extended from Bowling Green to Tontogany the present summer. This line is planned to eventually enter Napoleon.

Hillsboro, Ore.—The City Council is stated to have granted a franchise to the Oregon Electric Ry. Co. (A. E. Goddard, Secy., 63 Wall St., New York, N. Y.) through t..s city on Base Line St., and also granted a franchise to the United Railways Co. through the city by way of Main St., with the right to use either 1st, 2d or 3d Sts. for connection with the southern limits of the city.

Oxford, Pa.—The construction of the electric railway from Unionville Junction, on the Kennett Square division of the West Chester St. Ry., through this place to Oxford seems assured. Thos. E. O'Connell, Chas. Swayne, W. B. Seals are reported interested.

Parkesburg, Pa.—It is reported that the four-mile break in the Philadelphia-Lancaster electric railway system, between Parkesburg and Christiana, will soon be bridged. A couple of years ago work was begun on the section by the Tennis Constr. Co., but after about 3 miles of the roadbed had been graded the work was abandoned. The new owners of the franchises are said to be the McCall's Ferry Power Co. M. P. Cooper, of Christiana, Right of Way Agent.

Cardington, Pa.—The Philadelphia Rapid Transit Co. (Chas. O. Kruger, Gen. Mgr., 810 Dauphin St., Philadelphia), it is stated, is making arrangements to construct a double-track system from Cardington to Collingate. The company has already obtained the right of way from Cardington to Marshall Road, in Upper Darby Township, to a point near Lansdowne Borough. It is stated that the company contemplates running through Upper Darby Township into the borough of Clifton Heights, thence to Aldan, continuing to Collingdale.

Providence, R. I.—The Rhode Island Co. (A. E. Potter, Gen. Mgr., is reported to have announced that the contemplated improvements consists of building about 11,700 ft. of track on the Cranston cross town line, also extending its present Academy Ave. line about 2,750 ft. A car house will be built on Thurber Ave., one on Academy Ave. and the present Social St. car house in Woonsocket will be rebuilt. In addition to this, an addition of about 8,100 sq. ft. will be built to the repair shop.

Bristol, Tenn.—The Bristol St. Ry. Co. is stated to have granted a franchise to build, equip and operate a street car system in Bristol, Va. Work will begin at once, and a line from State St. to Virginia Institute will be completed and in operation within sixty days. The steel rails have already been purchased.

Rockport, Wash.—The engineers of the Cascade Valley R. R. Co., under L. M. Rice, of Seattle, are working on the final location of the projected electric line from Rockport through the Cascade Pass. W. A. C. Rouse, the president of the company, is reported to have announced that work on actual construction will begin within the next sixty days. Right of way is now being secured, and the final location has been made as far as Marblemount, a distance of 10 miles beyond Rockport.

Chehalis, Wash.—B. J. Weeks, of Tacoma, is stated to have asked the City Council for a franchise for the Centralia-Chehalis Electric Ry. & Power Co. It is proposed to build an interurban electric line between Chehalis and Centralia.

Seattle, Wash.—Articles of incorporation are stated to have been filed for the Puget Sound International Ry. & Power Co., of Portland, Me., by J. H. Drummond, W. G. Chapman, Gertrude M. Horne, of Portland, Me.; Benjamin Joy, J. S. Lovering, P. L. Warren, A. K. Todd and J. E. Rousmaniere, of Boston, Mass. Capital, $2,250,000. The object of the corporation, it is stated, is to build and operate a line of railway between Seattle, Everett, Bellingham and British Columbia. This is the Stone & Webster corporation that will construct the interurban announced some time ago to be built between Seattle and Vancouver, B. C.

**Wheeling, W. Va.*—The contract for the construction of the Fairmount & Mannington Electric Ry. Co. (F. H. Bailey, Gen. Mgr., Fairmount), 15 miles in length and connecting two of the largest towns in the interior of the State, is stated to have been let to the Blodget Constr. Co., of this city.

RAILROADS.

Notes Arranged Alphabetically by States.

Oyster Bay, L. I., N. Y.—Bids will be received until July 22 by the Bd. of Superv. (address to Wm. E. Luyster, Clk. Bd. Superv., Mineola) for constructing a sea wall along the harbor or east side of the West Shore Road, in Oyster Bay.

Rochester, N. Y.—Bids will be received until July 22 by Rich'd Gardiner, Purchasing Agt. of Monroe County, at Rochester, for furnishing the following materials: 16 M ft. B. M. of lumber, 50,900 lbs. of deformed steel bars, 3,806 lbs. of 3-in. "I" beams, 400 lbs. of bent steel bolts, 508 cu. yds. of broken stones, 254 cu. yds. of sand, 740 bbls. of Portland cement. Also for furnishing pipes, valves and fittings, and doing the necessary work for putting steam and hot water pipes in tunnels to be built at county buildings, and covering same with a bent nonconductor, 720 ft. of 5-in., 418 ft. of 3½-in., 3,528 ft. of 2-in. pipe.

Albany, N. Y.—Bids will be received until July 31 by F. C. Stevens, Supt. Pub. Wks., for improving the New York State canals as follows: Contract No. 12, Erie Canal, Secs. 6 and 7; Contract No. 14, Erie Canal, Secs. 1, 2 and 3; Contract 35, Oswego Canal, Sec. 1.

Panama.—Bids will be received until July 22 by D. W. Ross, Genl. Purchasing Officer, Isthmian Canal Comm., for furnishing swivels, chain, wire rope, differential blocks, belve hammer, etc.

Racine, Wis.—It is stated that bids will be received until July 20 by the City Clk. for building 200 ft. of lake shore protection. P. H. Connolly, Chmn. Bd. Pub. Wks.

CURRENT NEWS SUPPLEMENT

DIRECTORY OF NATIONAL TECHNICAL AND TRADE SOCIETIES.

AMERICAN SOCIETY OF CIVIL ENGINEERS. Secretary, Charles Warren Hunt, 220 West 57th St., New York.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS. Secretary, Calvin W. Rice, 29 West 39th St., New York.

AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS. Secretary, Ralph W. Pope, 29 West 39th St., New York.

AMERICAN INSTITUTE OF MINING ENGINEERS. Secretary, R. W. Raymond, 29 West 39th St., New York.

NATIONAL FIRE PROTECTION ASSOCIATION. Secretary, W. H. Merrill, Jr., Chicago.

AMERICAN INSTITUTE OF ARCHITECTS. Secretary, Glenn Brown, Washington D. C.

ASSOCIATION OF ENGINEERING SOCIETIES. Secretary, Frederick Brooks, 31 Milk St., Boston, Mass.

AMERICAN SOCIETY OF HEATING AND VENTILATING ENGINEERS. Secretary, W. M. Mackay, 113 Beekman St., New York.

CANADIAN SOCIETY OF CIVIL ENGINEERS. Secretary, Clement H. McLeod, 877 Dorchester St., Montreal.

SOCIETY FOR THE PROMOTION OF ENGINEERING EDUCATION. Secretary, Prof. M. S. Ketchum, University of Colorado, Boulder, Colo.

AMERICAN SOCIETY FOR TESTING MATERIALS. Secretary, Prof. Edgar Marburg, University of Pennsylvania, Philadelphia, Pa.

AMERICAN SOCIETY OF MUNICIPAL IMPROVEMENTS. Secretary, George W. Tillson, Room 12, Municipal Building, Brooklyn, N. Y.

ASSOCIATION OF RAILWAY SUPERINTENDENTS OF BRIDGES AND BUILDINGS. Secretary, S. F. Patterson, Concord, N. H.

AMERICAN RAILWAY ENGINEERING AND MAINTENANCE OF WAY ASSOCIATION. Secretary, E. H. Fritch, 962 Monadnock Block, Chicago.

AMERICAN WATER WORKS ASSOCIATION. Secretary, J. M. Diven, Charleston, S. C.

AMERICAN STREET AND INTERURBAN RAILWAY ASSOCIATION. Secretary, Bernard V. Swenson, 29 West 39th St., New York.

AMERICAN FOUNDRYMEN'S ASSOCIATION. Secretary, Richard Moldenke, P. O. Box 432, New York.

ENGINE BUILDERS' ASSOCIATION OF THE UNITED STATES. Secretary, J. L. Lyle, 39 Cortlandt St., New York.

AMERICAN PUBLIC WORKS ASSOCIATION. Secretary, W. H. Flint, Chattanooga.

ASSOCIATION OF AMERICAN PORTLAND CEMENT MANUFACTURERS. President, J. B. Lober, 1232 Land Title Building, Philadelphia.

NATIONAL ASSOCIATION OF CEMENT USERS. President, Richard L. Humphrey, Harrison Building, Philadelphia.

AMERICAN SOCIETY OF REFRIGERATING ENGINEERS. Secretary, H. W. Ross, Room 806, 258 Broadway, New York.

AMERICAN PUBLIC HEALTH ASSOCIATION. Secretary, Dr. C. O. Probst, Columbus, O.

THE WESTINGHOUSE GAS PRODUCER.

The Westinghouse Machine Co. has been experimenting for some years with gas producers, and at last has given out particulars concerning an apparatus which it is about to place on the market for use with anthracite, coke and other non-bituminous materials. Owing to the company's long experience in making gas engines and operating them with various kinds of producers, it has been able to acquire a large amount of information concerning all types of gas-producing plants. Its experimental work has also been conducted with great thoroughness, so that the producer which is now placed upon the market embodies only ideas that have been thoroughly tested for some time and consequently cannot be considered an experimental apparatus, although it is only now offered for sale.

The producer consists in general of a pair of vertical steel shells, one of which is the gas generator proper and is lined with fire-brick and tile, while the other is the combination scrubber-dryer from which the gas is led to the engine or other point of use. The two principal elements, generator and scrubber, are connected by a cast-iron gas main fitted with a water seal cut-out and stack valve, which, by a single movement, opens communication to the purge stack and simultaneously feeds the main to the scrubber, or vice versa. The automatic pressure controlling apparatus is mounted on the main producer shell. On account of the automatic balanced blast of the producer, the amount of gas generated is controlled entirely by the demand for gas, and, therefore, no gas holder is required, regardless of whether the gas is used in engines or for heating purposes.

The fuel is introduced into the double-seal charging hopper, preferably from an overhead bin, and thence distributed to the fuel bed by means of a counterweighted discharge and distribution bell. Accessibility for maintaining a uniform fuel surface is a prime requisite, and the producer top is specially designed to permit ready access to all portions of the bed. The blast must, of course, be composed of the correct proportions of steam and air, and an improved blower is used to keep this proportion constant, although the volume of the mixture is constantly changing with the demand for gas. Air for the blast is drawn through a jacket space covering the top of the generator, thus air-cooling the generator top and returning again to the system the lost heat. Steam is introduced into the preheated blast just before it enters the producer, the blower action of the steam jet being ample to maintain the slight pressure requisite to overcome the resistance of its passing through the fuel bed and scrubber chambers.

The mixture of air and steam is conducted to the fuel through a cast-iron duct built into the producer foundation, communicating with the tuyere box which forms a jacket around the blast pipe, protecting it from the cooling effect of the water in the ash-pit. The tuyere box is surmounted by a sectional cone-shaped blasthead or tuyere proper, so designed as to promote the free distribution of blast and prevent the passage from becoming clogged with ashes.

THE KOEHRING MIXER.

A number of peep holes are provided at the level of the normal ash zone so that the fire may be inspected to guard against the discharge of good fuel by a too rapid removal of the ashes. These holes also permit the introduction of a poker in case there is a bridging tendency from large clinkers. No further attention is required of the operator, except to remove the ashes as they accumulate below the fire zone in the water sealed bottom. The ashes can be removed at any time from the water bottom without in any way affecting the operation of the plant.

The strength and volume of the blast, the proportions of air and steam, and the rate of gas generation are all controlled automatically by a balanced pressure regulating system which is operated entirely by the rate of consumption of the gas. A manometer gauge board mounted in a convenient place on the scrubber shell shows at a glance the relative pressures in the blast pipe, the outlet of the producer, and the outlet of the scrubber or engine supply pipe. These pressure relations remain practically constant during normal operation, any changes serving as an index to conditions of gas supply and demand and also as a tell-tale to the existence of improper conditions in the fuel bed or any other part of the apparatus.

The gas made in these producers is intended for the operation of gas engines, but the apparatus may, of course, be used for furnishing gas for other purposes. Where these other purposes are to be supplied at the same time as the engines, the automatic pressure control feature of the Westinghouse producer is an important advantage. If the generation of gas for heating purpose is the prime consideration and high temperatures rather than a clean gas are desired, the producers may be installed without the scrubber and the gas conducted through hot-gas mains directly to the furnaces. In such cases, bituminous fuels may sometimes be used to advantage according to the makers.

A NEW CONCRETE MIXER.

A new concrete batch mixer, illustrated in the accompanying engraving, is noticeable on account of the fact that the materials are mixed dry and water is added separately after the mixture leaves the drum. The drum itself is cylindrical, with rounded edges on both heads in order to prevent the sticking of sand and cement in the corners. These drums are built in three sizes, for batches of 5 cu. ft., 9 cu. ft., and 22 cu. ft respectively, and may be obtained with gasoline-engine, steam-engine or electric-motor drive. The scoops within the drums are set at alternate and different angles to throw the material in opposite directions, and the tie rods which hold the ends of the drum are placed just below these scoops so that as the material is thrown on them they will assist in scattering it. The loading chute is of large size and very low so that materials can be placed in it readily.

As before stated, the object of the design of this machine is to mix dry only in the drum and add water in the wet-mixing trough. Material can be left in the drum as long as desired and in this way it is possible to mix cement with any desired coloring or waterproofing materials first, then add the gravel or sand, and keep on the mixing process until it is absolutely certain that everything is thoroughly well commingled. When the materials have reached this condition a lever is thrown and the water supply valve opened. The dry mixture falls into the trough, where it is beaten with paddles like those used in continuous mixers. If desired the wet-mixing trough can be replaced by a chute which discharges the materials at an elevation high enough to allow them to fall directly into wheelbarrows. This chute is made in two sections; that outside of the drum is stationary and that inside it tilts up when concrete is not wanted. The mixer is made by the Koehring Machine Co., Germania Bldg., Milwaukee, Wis.

A PROPOSED SOCIETY OF CHEMICAL ENGINEERS.

A meeting of chemists in favor of establishing a society of chemical engineers, who were in attendance at the convention of the American Society for Testing Materials, was held at Atlantic City on June 21. Dr. Charles F. McKenna was made chairman and Mr. William M. Booth secretary. Mr. Richard K. Meade stated that as editor of the "Chemical Engineer," he had issued a call for the meeting because of numerous requests that he should take the initiative in the organization of such a society. He further stated that he had been informed that a society of chemical engineers was in process of organization on the Pacific Coast, and he had been urged to make the movement a national one. He felt that such a society was really needed, and had sounded the profession by some fifty or more letters of inquiry to prominent technical chemists and engineers. A large number of those approached were in favor of the organization of such a society, to be known a the American Society of Chemical Engineers. Those in favor of the organization thought it should have a high standard of admission, somewhat along the requirements of the American Society of Civil Engineers, and that it would prove of great benefit to all qualified technical chemists. It was suggested that the society might, by the appointment of committees, solve many problems of engineering chemistry, widen the field of applied chemistry to the point where chemical plants will be designed as far as the chemical features go, by chemical engineers, discourage unprofessional methods, and, if possible, cause the elimination of incompetent and dishonest followers; it would also be able to indicate the direction of the education of technical chemists along lines most likely to be of benefit to the industries of the country, by commingling the ideas of professional men with those of teachers of applied chemistry; it could help the unification of the methods of technical analysis by committees which should represent both manufacturers and users, and it could encourage patent legislation which will give the greatest security to the inventor of chemical processes and appliances for carrying them out.

The discussion naturally turned first to what the term "chemical engineer" really means. This was answered provisionally by Mr. Booth as follows: Chem-

ists or mechanical engineers who design and construct plants of a nature requiring a thorough fundamental knowledge of applied chemistry may be termed chemical engineers.

The various difficulties in the way of forming a society of chemical engineers were gone into at great length, those who took part being Prof. H. B. Talbot, Mr. H. E. Diller, Mr. E. C. Holton, Prof. J. C. Olsen, Prof. Wm H. Walker, Dr. J. E. Stokes, Mr. Andrew Robertson, Mr. A. D. Little and Mr. Richard K. Meade. Finally it was decided to appoint a committee with power to consider the advisability of organizing a society of chemical engineers. This committee is to correspond with men likely to be interested, and formulate the conditions of membership in such a society. Dr. McKenna named the following as members of the committee: Prof. J. C. Olsen, Mr. A. D. Little, Mr. Richard K. Meade, Prof. Wm. H. Walker, Mr. William M. Booth. Mr. Olsen offered a motion that Dr. McKenna act as chairman of this committee, which was carried.

It is expected that a report will be made some time during the summer.

BRITISH ENGINEERS; AN APPRECIATION.

In an esteemed British contemporary, "Engineering," an unusual communication recently appeared from an engineer who modestly signs himself "H. S. C." Of course, it is merely a playful skit; even the editor took pains to indicate this by heading the letter, "Humors of Engineering." It reads as follows:

Sir.—If engineers were not so conspicuously lacking in a sense of the ridiculous, it would be impossible for many of them to assume the air of dignity and importance they do. After all, the engineer is not so indispensable as he fondly imagines. He is not indispensable at all individually; there are so many of him. This is particularly the case with the young engineer, full of enthusiasm and beautiful ideals.

Many and great are the quiet chuckles that the horny-handed foreman enjoys at the expense of the "young gent from the office." I know a young man in the engineer's department of one of our largest railway companies who made a serious duty of permanent-way curves, and the scientific setting out thereof. He studied Froude's transition curves, and he babbled fearful formulæ in his sleep. To him it was given to set out a deviation from the main line. Days and nights he spent in calculation; midnight oil and language were freely squandered. Still more days he spent upon the site, and did wonderful things with a theodolite, four chainmen, a bundle of wooden pegs, and a sledge hammer. At length a row of pegs was arranged in parabolic symmetry and punctilious accuracy. Then, weary and triumphant, the young man went his way. Then came the ganger with a crowbar and a sledge-hammer, and thus addressed his mate:

"'Ere Bill, give I a hand, and get those 'ere . . . pegs out o' the light, and let's have the . . . line in proper" . . . And they did. When the chief inspected that bit of line, on completion, he complimented his young assistant on the alignment, and that young man became the permanent-way expert of the office. Everybody was pleased, and I was the only one that smiled.

To the pupil belongs the honor of possessing the noblest sense of appreciation of his profession. My little chuckle of amusement is often tempered with a touch of pity when I observe the hours of toil some enthusiastic and thoroughly conscientious youth will spend on a little job which I happen to know has only been given to him in order to "get him out of the way and keep him quiet." See him carefully trace the buildings that no longer exist, and cross them out in red, because that is how they appear on the old and corrected plan beneath, and say if that is not enthusiasm. Go into one of those underground café places where the junior clerk plays dominoes, and consumes coffee and buns, and see the earnest and anæmic-looking youth in the corner, painfully studying an entirely unpractical book on "Building Construction," with a cotton umbrella and a small black bag by his side. That is the engineering pupil. He has a high ideal of his profession, and some day he will be able to earn as much as a pound a week, and call himself "a professional man."

Next to the pupil comes the "surveying assistant" or "general draughtsman." He describes himself in his own mind as "a fully qualified man." There is nothing in heaven or earth or in the waters beneath the earth, that, as an engineer, he is not capable of dealing with. What he actually does is to mark the numbers of the houses in a long street on the ordnance map, and count the lampposts. In the train from Clapham to Waterloo he discourses learnedly to the awe-stricken passengers on the subject of Channel tunnels, dangerous towers, and electric railways, and when he gets to the office he spends the whole morning stencilling the names on a plan, and making it look lovely with a camel-hair brush, and it never strikes him as being funny.

But the funniest of them all is the chief. His great idea is that he is a "busy man." His time is very valuable. So valuable is it that he has not time to be a gentleman. In order to convey to all and sundry a proper idea of his importance, and the terrible amount of work he has to get through, he is very brusque in his manner, and bullies his assistants (in public, if possible), also other people's assistants, if they look as though they will stand it. If he comes from the North, and is less like a gentleman than usual, he is probably a Borough Engineer, and a very great and busy man indeed. So important is he that he has been known to hob-nob with the local Labor member, and other great and influential people like that.

To realize his importance properly you should call at his office, and endeavor to see him without making an appointment beforehand. The Borough Engineer's office is usually at the Town Hall; in fact, the Town Hall is part of the Borough Engineer's office. You cannot miss it. There are notices up everywhere, "To the Borough Engineer's office." You are met by a gorgeous official, arrayed in blue and much fine gold, absolutely regardless of expense (which, of course, comes out of the rates). In reply to your request to see the borough engineer, he silently hands you a printed form to fill in, and on it you write your name, official address, nature of business, time of visit, and whether by appointment or not. Then, if you really have legitimate business, and are not merely looking for work or something downright impertinent like that, the gorgeous official disappears with the form, and leaves you in a draughty corridor for about five minutes. In nine cases out of ten the official will come back drowsily and say, "The engineer is very busy just now. Will you see Mr. ——, the Assistant Engineer?" The Assistant Engineer is probably an untidy-looking young man with a thick provincial accent, and baggy trousers. He will probably be a Borough Engineer himself one day. He looks as if he might. It is really better to see the assistant, because he knows more about the business, and you would be sure to be handed over to him in the long run anyway. Besides, you are not quite so much insulted, unless, of course, you appear to be a person of refinement, or something contemptible of that sort. But sometimes the official comes back and says, "Will you wait a few minutes, the engineer is engaged at present." You decide to wait. After an interval of an hour or so, you are ushered into the presence. In a luxurious office, surrounded by papers and despatch-boxes, sits the great man, who, without saying a word, or noticing your entrance in any way, continues to read a letter for the space of three minutes, while you stand just inside the door and mildly wonder why borough engineers have no manners. Then he seems to realize that there is something alive in the office—a fly, or some other small and annoying thing—and looks up with an impatient expression, and says, "Well?" The interview lasts exactly two minutes, and then he strikes a small table bell, and so far as that Borough Engineer is concerned, you have ceased to exist.

And "when the laborer's task is o'er," that is to say, about three o'clock, the great man goes home to Peckham, or Upper Tooting, and does a bit of gardening.

THE LABOR INFORMATION OFFICE FOR ITALIANS.

It is only within the last 15 years or so that immigration from Italy has become heavy, but of late it has exceeded that of all other nationalities. A very large proportion of the Italians coming to this country are uneducated and poor, and it is extremely desirable that they should be kept out of the clutches of the labor sharks who have exploited them so outrageously in the past. Impressed by this condition of affairs, some well-known Americans, including Augustus A. Healey and G. P. Morosini, organized about a year ago a labor exchange for the purpose of acting as a free intermediary between those seeking employment and those who would employ them. This office was opened under the name of the Labor Information Office for Italians, and is now located at 59 Lafayette St., New York. During the year it has secured employment for 7,195 immigrants and has received applications for help from 319 employers. In addition it has also furnished information concerning work and wages to a good many thousands of Italians. One object of the gentlemen who have established this office is to distribute the immigrants as far as possible throughout the country, and so avoid crowding them into the large cities of the East, which has been an unfortunate recent tendency. By temperament and experience they are of much greater profit to this country in the western and southern agricultural regions than they are in the large cities, and the Office is particularly desirous of sending its men to such places. The extreme poverty of the immigrants prevents their purchasing land, but it would seem that many of them are particularly well fitted for participation in irrigation and other development work in the semi-arid districts where labor is now scarce.

PERSONAL NOTES.

Mr. W. C. Hood, of Lawrence, Kan., has been elected sanitary engineer of the Kansas State Board of Health.

Mr. John C. Grady has been appointed director of the Department of Wharves, Docks and Ferries of Philadelphia.

Civil Engineer U. S. G. White, U. S. N., has been detached from the Navy Department offices at Washington and transferred to the Naval Academy.

Major William C. Langfitt, chief engineer officer of the Army of Cuban Pacification, has been ordered to Washington Barracks as commandant of the Engineer School.

Mr. H. F. Baldwin, formerly chief engineer of the Chicago & Alton Ry., has been appointed chief engineer of the Oregon & Washington R. R., succeeding Mr. E. C. Hawkins.

Mr. Charles A. Hoppin, formerly district superintendent of erection in the New York office of the Allis-Chalmers Co., has been appointed steam engineer of the Peoria Gas & Electric Light Co., Peoria, Ill.

Mr. W. C. Hebbard, division engineer of the New York, Susquehanna & Western R. R., at Jersey City, N. J., has been transferred to Buffalo, and has been succeeded at Jersey City by Mr. T. W. Whitney, formerly division engineer of the Delaware Division of the Erie R. R.

First Lieutenants John J. Kingman and Henry H. Robert, Corps of Engineers U. S. A., have been ordered from the Engineer School at Washington Barracks to duty in the Philippines, under Lieut.-Col. John Millis, in charge of all fortification construction in the Philippine Islands.

Mr. H. Milliken, who for the past two years has been associated with the operating department of the New York Edison Co., has joined the engineering staff of W. S. Barstow & Co., of New York City and Portland, Ore. He will be located permanently as resident electrical engineer in Portland.

Messrs. Chester A. Garfield and Edward T. Grandlienard, of Cambridge, Mass., and Hicksville, N. Y., respectively, have been appointed assistant engineers in the service of the Board of Water Supply of New York City. Mr. Hobert B. Potter, Newark, N. J., has been appointed an assistant engineer.

Messrs. George H. Cushman and J. A. Fairleigh have formed a partnership for the general practice of engineering and have opened offices in the Loveman Building, Chattanooga, Tenn., under the firm name of Cushman & Fairleigh. Mr. John Dowling is associated with them as consulting engineer for blast furnace work.

Messrs. Maurice Gesundheit and Henry Osgood have opened offices at 43 Cedar St., New York City, as manufacturing engineers and business methodizers, under the firm name of Gesundheit-Osgood Co. Mr. Gesundheit was assistant professor for two years at the Victoria University, England; later he was employed for a number of years in improving industrial plants; during the last few years he has served industrial concerns in a supervisory and consulting capacity, with the object of developing their earning power, by improving their methods and accounting, their equipment and processes, as well as their general policies. Mr. Osgood has been connected with several prominent manufacturing companies and has also been engaged in methodizing work.

Sir William Henry Perkins, the eminent technical chemist who visited this country last fall, died in London on Sunday. He was born in that city on March 12, 1838, and was educated at the City of London School, the only school in England at that time where scientific subjects were taught. He studied chemistry under Dr. A. W. Hofmann at the Royal College of Chemistry. When seventeen years old he acted as assistant to Dr. Hofmann in his research laboratory, and one year later read an account of his first research before the Chemical Society. In 1856, while making an experiment at home which had for its object the artificial formation of quinine, he obtained results which led him to the discovery of the aniline purple, or mauve. After experimenting with this coloring matter in Messrs. Pullar's dye works at Perth, and being encouraged by them to follow up the manufacture, he left the College of Chemistry and devoted his time to the development of his new discovery, which was patented in 1856. He then formed a partnership with his father and brother, and the firm was known as Perkins & Sons. The works were erected on the Grand Junction Canal at Greenford Green, Middlesex. The new dye was successfully made in 1857, and supplied first to the silk dyers in London, and then at Macclesfield, and later to calico printers in Scotland and elsewhere. For his discovery of mauve the Société Industrielle of Mulhouse presented to him silver and gold medals. Besides the mauve, he discovered also several other coal tar coloring matters, and after Graebe and Liebermann had made their discovery of the formation of alizarine from anthracene, in 1868, he found two new processes by which this was rendered of practical value.

Mr. A. B. Lewis has been re-elected as borough surveyor of Mahanoy City, Pa.

Mr. Jere A. Hunter, chief of the Bureau of Highways of Philadelphia, resigned July 11.

Mr. Alexander C. Shand, Chief Engineer of the Pennsylvania R. R., sailed for Europe recently.

Mr. T. R. Atkinson, Assistant State Engineer of North Dakota, has been appointed State Engineer to succeed Mr. A. L. Fellows, resigned.

The fourth biennial exhibition of the Pittsburg Architectural Club will be held in the art galleries of the Carnegie Institute early in November.

The New York Testing Laboratory has been removed from Long Island City, N. Y., to Maurer, N. J. The New York City office is at 114 Liberty St.

Capt. George P. Howell, Corps of Engineers, U. S. A., in charge of the defensive works on the coast of South Carolina and of extensive river and harbor work at Charleston, has been ordered to the Philippine Islands for duty in connection with the construction of fortifications.

Mr. Peter Cooper Hewitt, inventor of the glow light that bears his name and the mercury arc rectifier, has built a 27-ft. boat with gliding planes projecting from her side which has attained a speed of 38 miles an hour. The remarkable craft, which is termed a hydroplane, is driven by an eight-cylinder gasoline engine.

Capt. William Kelly, Corps of Engineers, U. S. A., assistant to the Engineer Commissioner of the District of Columbia, has been appointed to supervise the construction of the municipal building for the District of Columbia, succeeding Maj. Chester Harding, who was recently made division engineer of the Eastern division of the Panama Canal.

The associate professorship of civil engineering at the State School of Mines, University of Utah, Salt Lake City, is vacant, and Prof. Richard R. Lyman, head of the department, is now receiving the applications of candidates for the position. A man with experience in surveying and railway engineering is needed, and preferably one who has acted as a teacher.

William Henry Colesberry, a civil engineer, who, since 1863 had been connected with the engineers corps of many of the Eastern railroads, died in Philadelphia, July 12. He entered the service of the Pennsylvania R. R. in 1863, with the corps engaged in the construction of the Connecting Ry., under the late A. J. Cassatt. Later he aided in the survey and construction of the Philadelphia & Erie R. R. In 1868 he was constructing engineer on the Vineland Ry., and in 1871 was chief engineer of the Smyrna & Delaware Bay R. R. In 1876, after spending some years in locating and constructing railroads in the Pennsylvania oil regions, he re-entered the service of the Pennsylvania R. R., and was connected with the various improvements of that road in and about Philadelphia.

Mr. W. J. Wilgus has several times during the past two years suggested his desire to retire from his official connection with the service of the New York Central & Hudson River R. R. Co., but the great work of changing from steam to electric power in the Electric Zone, and the reconstruction of the Grand Central Terminals, made it almost impossible for the company to comply with his wishes. The initial installation of electricity having been completed and the practicability and success of handling the business of the road by the new power having been fully demonstrated by months of successful operation, Mr. Wilgus renewed his request to be relieved at as early a date as practicable, suggesting July 1 as the date. At the earnest request of President Newman, however, Mr. Wilgus has consented to remain in his present position until Oct. 1; and, with this understanding, his resignation effective on that date has been reluctantly accepted. He entered the company's service in June, 1893, as assistant engineer in charge of maintenance of way of the Rome, Watertown & Ogdensburg R. R., and since then has steadily risen by reason of his technical efficiency and administrative ability to the position of vice-president of the New York Central road. The public will regret that he is not to stay in office and complete the great terminal improvements he planned.

The Baldwin Locomotive Works of Philadelphia have issued a pamphlet on the actual efficiency of a modern locomotive, represented by work performed, as compared with the lighter locomotive of twenty years ago, being a reprint of a paper read before the Pacific Coast Railway Club by Mr. Wm. T. Evans. The paper is an analysis of the present stage of steam locomotive development, taking up efficiency, costs and operating results in service on many roads. There is also an appendix on the extra work department of the Baldwin Locomotive Works, in which the extensive facilities of the company for supplying repair parts is outlined, as well as the Baldwin system of interchangeability of small parts of standard locomotives.

CONTRACTING NEWS

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS, ENGINEERS AND MANUFACTURERS
ENGINEERING AND BUILDING SUPPLIES

WATER.

Notes Arranged Alphabetically by States.

Russellville, Ark.—Bids will be received by the Bd. of Water Comrs. (R. M. Newport, Chmn.) until Aug. 20 for furnishing material and constructing water works, as advertised in The Engineering Record. Engineers, M. A. Earl & Co., of Muskogee, Ind. Ter.

Paris, Ark.—The Commercial Club (J. A. Maddox, Secy.), is reported interested in the construction of water works.

**Los Angeles, Cal.*—The Bd. of Pub. Wks., Aqueduct Dept., has awarded to Byron Jackson Machine Co., of San Francisco, the contract for a 12-in sand and gravel dredge pump for $1,250.

Molina, Colo.—It is reported that bids will be received by the Cottonwood Lakea Reservoir Co. (J. A. Kirkendall, Secy.) until July 25, for constructing cement concrete box, with patent headgate, at No. 1 Lake.

Monitou, Colo.—Mr. Nichols, Mayor, writes that the question of constructing reservoir will not be taken up until fall.

Lamar, Colo.—The citizens are reported to have voted to issue $150,000 bonds for the improvement of the water works.

Orchard, Colo.—Bids will be received until Aug. 1 by the Bd. of Directors of the Riverside Irrigation Dist. (R. H. Beem, Secy.), for $747,500 bonds for said Dist.

Bradentown, Fla.—Bids will be received until July 25 by the Bd. of Bond Trus. (A. J. Beck, Secy.), for turnishing material and constructing water works and sanitary sewerage system. Work embraces the following: 183.3 tons c. i. pipe, 4 tons of special castings, 10 fire hydrants, 22 valve and boxes, 500,000 gal. compound duplex pump, boiler feed pump 7½x5x6, 80 h.-p. water heater, open pattern, 80 h.-p. return tubular boiler, 100,-000 gal. tank erected on steel tower 100 ft. high, constructing reservoir, pumping station, pipe line, installing machinery, furnishing material and sinking 8-in. tubular well, per ft., furnshing and constructing approximately 2 miles pipe sewerage, with manholes, flush tanks, etc. Wm. W. Lyons, Engr., Palatka, Fla.

Rome, Ga.—J. N. Hazlehurst, of Mobile, Ala., is reported to have been selected as engineer in charge of water, paving and sewerage improvements for which the citizens recently voted to issue $150,000 bonds.

Catoosa Springs, Ga.—Bids will be received until Aug. 8 by Capt. F. D. Anderson, 12th Calvary, Q. M., Ft. Oglethorpe, Ga., for a deep well and water system at the Government target range at Catoosa Springs, Ga.

Calhoun, Ga.—See "Power Plants, Gas and Electricity."

Winder, Ga.—The citizens are reported to have voted on July 7 to issue $45,000 water bonds.

Boise Barracks, Idaho.—The following are the bids opened on July 1 by Capt. John S. Winn, Q. M., U. S. A., Boise, for constructing water distribution system, consisting of 6,900 ft. of 4-in. c. i. pipe and connections: Saml. T. Davis, Boise, $10,660, and Carlson Lusk Co., Boise, $10,782.

Chicago, Ill.—Bids will be received until July 23 John J. Hanberg, Comr. of Pub. Wks., for furnishing and delivering at the Harrison St. pumping station a new pump barrel and bottom made in 3 sections and 1 valve chamber; also same date for approximately 5,000 ¾-in. corporation ferrules.

*The following are reported to be the bids opened on July 10 by Paul Redreske, Deputy Comr. of Pub. Wks., for foundation work of new Lake View pumping station, Lawrence Ave. and the lake: American Eng. & Constr. Co. (Walter A. Shaw, Pres.), $91,400 (awarded contract); John J. Gallery, $97,000; M. H. McGovern, $106,570; John J. O'Heron, $110,000; D. West & Co., $109,995; Blocki and Brennan, $113,500; Wm. E. McCarthy, $114,000; John P. Dougherty, $115,000; Gindele Bros. Co., $115,735; Roemheld Constr. Co., $127,000, and Geo. W. Jackson, Inc., $149,000.

East Moline, Ill.—Thos. E. Cavely, City Clk., writes that it is proposed to construct a complete system of water works.

**Moline, Ill.*—The Moline Htg. & Constr. Co., of Moline, is reported to have secured the contract for sewers and water main improvements for about $6,000.

Mattoon, Ill.—The Mattoon Water Works & Reservoir Co. will receive bids until 2 P. M. July 24 for building dam, trenching and laying 5 miles of pipe, and furnishing 3 miles of vitr. sewer pipe. Specifications on file in the office of C. L. James, City Engr., of Maltoon.

*Loomis & Rose, of Mattoon, have secured the contract for constructing a reservoir for the Mattoon Water & Reservoir Co. (bids opened July 13) for $8,890.

Cherokee, Ia.—Bids will be received until Aug. 6 by the City Council for constructing approximately 2,000 ft. of 4-in. and 2,000 ft. of 2-in. water main extensions. D. W. McNeal, City Clk.

Decorah, Ia.—Bids will be received until Aug. 5 by the Bd. of Superv. at Decorah, for constructing a water system at the poor farm at Freeport on either the automatic air pressure steel tank of 75 bbl. with 125 lb. pressure to the inch, 12-ft. steel wheel, steel tower 70 ft. high and pump to complete the job, or 500-bbl. tank overhead system, 60 ft. high. I. Linnevold, Co. Aud.

**Bode, Ia.*—The Des Moines Bridge & Iron Wks., of Des Moines, is reported to have secured contract for the erection of an 80-ft. steel tower and 40,000 gal. steel tank for $3,483.

Almena, Kan.—Bonds to the amount of $15,000 have been voted for water works.

Shreveport, La.—The Council is stated to have accepted the report of Dr. Ashton Blanchard, health officer, relative to changing source of water supply. Red River is recommended. Probable cost of work $50,000.

Wareham, Mass.—The citizens are reported to have voted to appropriate $50,000 for the construction of water works.

Marion, Mass.—The citizens are reported to have voted to expend $1,000 for further investigations as to a water supply. Engineer, Louis E. Hawes, 101 Tremont St., Boston.

**Wrentham, Mass.*—We are informed that G. Ferrullo & Co., of Boston, have secured the contract for constructing water works (bids opened July 3), at the following bid: 7,000 ft. 10-in. c. i. pipe, including unloading, hauling, etc., 29 cts.; 10,000 ft. 8-in. c. i. pipe, 27 cts.; 16,000 ft. 6-in. c. i. pipe, 25 cts.; 2,800 ft. 4-in. c. i. pipe, 23 cts.; excavation for foundations per cu. yd., 50 cts.; concrete for stand pipe and pump foundation per cu. yd., $5; rock excav. per cu. yd., $3.75; laying service connection and materials per connection, $10.50 Engr., Edw. M. Blake, 8 Beacon St., Boston.

Ishpeming, Mich.—Bonds to the amount of $35,000 are reported sold, to be used for extending water mains and equiping new pump house.

St. Paul, Minn.—The Water Bd. is reported to have passed a resolution on July 8 requesting Council to authorize the issue of $50,000 bonds to carry on improvements to the outside water system.

Dawson, Minn.—See "Power Plants, Gas and Electricity."

Belleplaine, Minn.—Oscar Claussen, of St. Paul, is preparing plans for water works, to cost about $8,000. It has not yet been definitely determined to build.

Newton, Miss.—Bids will be received until July 23 by the Mayor and Bd. of Aldermen for sinking one or more wells, approximately 300 ft. deep. For specifications apply to Xavier A. Kramer, Consulting Engr., Magnolia.

Speed, Miss.—It is stated that bids will be received by the Mayor and Bd. of Aldermen until Aug. 6 for the erection and sale of a water works system or the maintenance of water works and water supply for public and private use. T. T. Barber, Town Clk.

Savannah, Mo.—Bids were opened on July 2 at the office of L. W. Booker, City Clk., for water works and tank and tower, and the following are the bids received: (Engineers, Burns & McDonnell, Kansas City, Mo.):

*Water works: Municipal Constr. Co., Kansas City, Mo., $29,000; Des Moines Bridge & Iron Co., Des Moines, Ia., $28,777; Mott & O'Bryan, Independence, Mo., $28,500; N. S. Sherman Machinery Co., Oklahoma City, Okla., $27,900; T. C. Brooks & Sons, Jackson, Mich., $25,943; Fred. M. Clark, Savannah, Mo., $25,900 (awarded contract).

*Steel tower, 120 ft. high, and tank, 100,000 gal. capacity: American Bridge Co., $6,420; Horace E. Horton, Chicago, Ill., $5,400; Midland Bridge Co., Kansas City, Mo., $4,989; Des Moines Bridge & Iron Co., Des Moines, Ia., $4,940 (awarded contract).

St. Louis, Mo.—It is stated that Water Comr. Adkins will petition the Bd. of Pub. Improv. for permission to install a battery of boilers at Bissell's Point to cost about $40,000.

Fremont, Neb.—See "Power Plants, Gas and Electricity."

Oxford, Neb.—We are informed that bids are wanted by City Clk. for the purchase of bonds for water works. As soon as bonds are sold, contract will be let for the work. Engineers, M. A. Earl & Co., of Muskogee, Ind. Ter.

Bradshaw, Neb.—C. B. Palmer, Village Clk., writes that bids will be received about Aug. 1 for the construction of water works; cost about $6,000.

Omaha, Neb.—Press reports state that Minard L. Holman, of the firm of Holman & Laird, of St. ouis, Mo., has been engaged by the City of Omaha to prepare preliminary plans and estimates for new water works.

Woodbury, N. J.—We are informed that a committee of Council is investigating the question of constructing water works.

New York, N. Y.—The lowest bid opened on July 11 by John H. O'Brien, Comr. Water Supply, Gas and Electricity, for furnishing, delivering and laying water mains in New Chambers, Water, Oliver, Henry and Pike Sts., and in James Sl., was submitted by Wm.T. Norton, 27 W. 140th St., at a total of $79,339, including pipe, hydrants, stop cocks, etc. He bid for 1,050 tons straight pipe $37, 50 tons specials $70, 15 tons flanged pipe $60, 7 tons gate boxes $55, 25 cu. yds. rock $5, 250 cu. yds. rock 1 ct., 150 cu. yds. masonry $2, 8,500 cu. yds. earth 80 cts., 8,500 cu. yds. fill 20 cts., 5,600 lin. ft. 30-in. pipe $1.10, 100 lin. ft. 20-in. pipe 75 cts., 600 lin. ft. 12-in. pipe 50 cts., 800 lin. ft. 6-in. pipe 25 cts., 60 lin. ft. 36-in. flanged pipe $2, 180 cu. yds. brick masonry $15, 100 cu. yds. concrete masonry, $7, 2,500 sq. yds. asphalt pavt. $4.40, 450 sq. yds. granite block $2, 650 sq. yds. pavt. 60 cts. The totals of the other bids received were: Wilton Constr. Co., 115 Elliott Ave., $86,116; L. D. Gregory, 125th St. and 1st Ave., $88,197, and Atlanta Constr. Co., 432 E. 91st St., $81,965.

Martinsburg, N. Y.—J. A. Taylor, Secy. Water Comn., writes that bids will be received until 7 P. M. on July 20 for the construction of water works; probable cost, $10,000. Engineer, S. S. Snell, of Lowville.

Oswego, N. Y.—See "Power Plants, Gas and Electricity."

Honeoye Falls, N. Y.—A. B. Neal, Village Clk., writes that the question of constructing water works and a sewerage system is being discussed. No action taken as yet and no appropriation has been made.

Lestershire, N. Y.—The Water Comrs. are reported to be considering the sinking of a new well.

Albany, N. Y.—The following are the totals of bids opened on July 12 by the State Water Supply Comr. for straightening, deepening and improving Canaseraga Creek, Kishaqua Creek and other ditches in Livingston County, N.

* *Items marked thus give the names of parties awarded contracts.*

Y. The work includes about 677,100 cu. yds. earth excav., [illegible] cu. yds. earth fill. and embkmt.; clearing and grubbing; 15,000 lin. ft. round timber; 89.3 M ft. sawed timber; 400 piles; 1,090 cu. yds. concrete; 358,000 lbs. structural steel for bridges, and 3,800 lin. ft. pipe railing: Graves & Stephens, Cleveland, O., $146,501; Pennell & Ahearn, Yonkers, $169,485, and Gilmor, Horton & Allen, Glens Falls, $172,259.

Shelby, N. C.—J. F. Liddy, City Clk., writes that bonds to the amount of $115,000 will probably be sold in Aug., after which bids will be called for constructing water works and a sewerage system. Engr., H. E. Knox, Jr., of Shelby; J. L. Suttle, Mayor.

Wahpeton, N. D.—Bids will be received until Aug. 5 by Wm. R. Purdon, City Aud., for constructing and placing boilers for the water works plant. The boilers are to be for a 66-in. x 18-ft. boiler and a 72-in. x 18-ft. Separate bids on each boiler.

**Rugby, N. D.*—W. D. Lovell, of Minneapolis, Minn., is reported to have secured the contract for constructing water works at Rugby, for $9,700.

**Harvey, N. D.*—The contract for constructing water works at Harvey is reported to have been awarded to W. D. Lovell, of Minneapolis, Minn., for $8,000.

Columbus, O.—Bids will be received until Aug. 14 by the State Bd. of Pub. Wks. (Chas. E. Perkins, Ch. Engr.), at Columbus, for the construction of a reservoir in Summit County. The work includes about 17,000 cu. yds. of earth embankment, 24 M ft. B. M. timber and planking and 400 cu. yds. concrete masonry.

Youngstown, O.—Bids will be received until July 26 by the Bd. Pub. Service (W. H. McMillin, Clk.), for furnishing 10 tons of soft pig lead, 400 tons c. i. water pipe and special castings, 38 6-in. gate valves and 40 fire hydrants.

Cambridge, O.—It is reported that bids will be received until Aug. 3 for $38,000 bonds, for extending water works system, repairing bridges and for other public improvements. T. R. DeSelm, City Aud.

Norwood, O.—Bids will be received by the Bd. of Pub. Service (L. H. Gebhart, Clk.), until Aug. 3 for furnishing meters and connections to be delivered in quantities of 100 or more as ordered, as advertised in The Engineering Record.

Cincinnati, O.—Local press reports state that bids will be received until Aug. 13 for $500,000 water works bonds.

Greenwich, O.—It is stated that bids will be received until July 23 by J. G. White, Clk. Bd. Pub. Affairs, for rebuilding and reconstructing spillway of the water works.

Mountain View, Okla.—Bids will be received until July 23 for the furnishing material and constructing water works. Amount of bond issue, $20,000. A. E. Stinson, Mayor; W. P. Bullock, Engr.

Guthrie, Okla.—An election will probably soon be held to vote on raising $110,000 bonds for water works, sewer, paving and bridges. W. W. Miller, City Engr.

Mosquite, Ore.—The Bd. of Directors of the Snake River Irrig. Dist. of Mosquite (C. P. Lattig, Ch. Engr.) have authorized the issue of $325,000 bonds to construct a complete hydro-pumping plant for irrigation of district. Bids for bonds and plant will be received on July 30.

Steelton, Pa.—Bids will be received by John D. Young, Boro. Secy., until Aug. 7 for the construction of a filter plant, as advertised in The Engineering Record. Engineer, Jas. H. Fuertes, 140 Nassau St., New York, N. Y.

Dickson, Tenn.—W. T. Turner, Mayor, writes that the question of constructing water works is being discussed. Nothing definite has yet been done. Election will probably be held in near future.

Monterey, Tenn.—See "Power Plants, Gas and Electricity."

Stephenville, Tex.—See "Power Plants, Gas and Electricity."

Mineral Wells, Tex.—The Council is reported to be considering the question of establishing a filter plant.

American Fork, Utah.—The Mayor, City Council and Commercial Club are reported to be considering the question of piping water from Alpine Canyon to American Fork and Lehi.

Bremerton, Wash.—See "Public Buildings."

**Chewelah, Wash.*—See "Power Plants, Gas and Electricity.

Delta, B. C.—J. H. Hutchinson, of Ladner, is reported to be planning to build a water system through Delta and Surrey.

SEWERAGE AND SEWAGE DISPOSAL.

Notes Arranged Alphabetically by States.

Camden, Ark.—Bids will be received until Aug. 15 by the Comrs. of Improv. Dist. No. 2 (Louis Bauerlein, Secy.), for constructing a sewer in said dist., approximately 12,000 ft. long.

Montrose, Colo.—The question of constructing a sewerage system here is reported to be under consideration.

Hartford, Conn.—Bids will be received by the Bd. of Contract & Supply until July 29 for constructing Sect. A of the Homestead Ave. intercepting sewer, consisting of about 1,070 lin. ft. of concrete conduit, 10 ft. diam. and 650 ft. concrete or brick conduit of egg shaped section 6x4 ft. diam., as advertised in The Engineering Record.

*The Hartford Paving & Constr. Co., of Hartford, is reported to have secured the contract to build the Ann St. sewer (bids opened July 15), for $17,391. It will be of concrete.

Wilmington, Del.—Alex. J. Taylor, Engr. in Charge of Sewers, is reported to have prepared plans for a sewer for the lower end of the 9th Ward, to cost complete about $25,000.

Washington, D. C.—The lowest bid opened on July 15 by the Comrs. D. C. for constructing sewers was submitted by Jas. A. Coyle at the following bid: 6,000 cu. yds. sewer excav., 90 cts.; 45 cu. yds. brick masonry, $20; 3,725 lin. ft. 10-in. pipe sewer, 80 cts., and 2,135 lin. ft. 12-in. pipe sewer 90 cts;; total, $11,201. Totals of other bids: R. J. Beall Constr. Co., $11,936; E. G. Gummell, $13,175, and Lyons Bros., $14,298. D. E. McComb, Supt. of Sewers.

Bids will be received by the Comrs. D. C. until July 29 for construction of outlet to old B St. sewer, as advertised in The Engineering Record.

Bradentown, Fla.—See "Water."

Rome, Ga.—See "Water."

Chicago, Ill.—Bids will be received until July 23 by John J. Hanberg, Comr. of Pub. Wks., for furnishing material and constructing complete the sewage screens, lifting apparatus, operating galleries, ladders and railings and other appurtenances at the Lawrence Ave. pumping station; also, same date, for furnishing material and constructing about 200 lin. ft. of 9-ft. sewer, including stone masonry outfall on pile timber foundation in Canal Pl.

Belleville, Ill.—Bids will be received by the Bd. of Local Improv. until July 27 for 80,750 sq. yds. brick paving, 46,900 lin. ft. curb and 37,943 lin. ft. sewer pipe, as advertised in The Engineering Record. Estimated cost of work, $266,115.

Mattoon, Ill.—See "Water."

Pekin, Ill.—Local press reports state that bids will be received on July 29 by J. H. Soldwedel, City Clk., for theconstruction of the 4th District sewer; cost about $115,000. John R. Siebert, City Engr.

River Forest, Ill.—It is stated that bids will be received until Aug. 5 by the Bd. Local Improv. (F. B. Klock, Pres.) for constructing a sewer in Chicago Ave.

Benton, Ill.—The City Clk. writes that bids will be received until July 22 for tile sewers, to cost about $20,000. J. M. Joplin, Mayor. Engineer, B. S. Crain, of Morton.

Moline, Ill.—See "Water."

Indianapolis, Ind.—Bids will be received until July 24 by the Bd. Pub. Wks. (Jos. T. Elliott, Pres.), for constructing a main sewer in portions of Crawfordsville Road and Harding St., consisting in part of circular concrete sewer varying from 3 to 6 ft. in diameter, and in part of pipe sewer from 10 to 24-in.

Bloomfield, Ind.—Bids will be received until Aug. 8 for pipe, branches, junctions, manholes, etc., f. o. b. cars Bloomfield, and for construction complete with or without material or any part of same separate of main and minor sewers in a system of sewerage, etc., as advertised in The Engineering Record. Engr., Geo. Cadogan Morgan, 169 Jackson Boule., Chicago, Ill.; Chas. E. Coombs, Pres. Bd. Town Trus.

Webster City, Ia.—Bids will be received until July 24 for constructing combined storm and sanitary sewers in portions of several streets, including 15, 18, 20 and 24-in. vitrified clay bell sewer pipe. P. M. Banks, City Clk.

**Horton, Kan.*—B. B. Norris, City Clk., writes that the following are the bids opened on July 1 for the construction of 9,315 ft. 8 in. D. S. pipe sewers: T. W. Roberts, Independence, Mo., $8,312 (awarded contract); G. O. Skilbred, St. Joseph, Mo., $8,977; Rackliffe-Gibson Const. Co., St. Joseph, Mo., $10,202, andD. B. Kelley, St. Joseph, Mo., $10,361.

Louisville, Ky.—Local press report sstate that sewer bonds to the amount of $157,000 were sold on July 10. Th balance of the $1,000,000 bonds advertised for may be bought at par and interest until July 31. For further information address Chas. P. Weaver, Secy Bd. of Sewer Comrs.

Salem, Mass.—This city is reported to have voted to build sewers in South Salem at a cost of $100,000.

Jackson, Mich.—The Council is reported to have on July 8 approved plans for sewers.

Winnebago City, Minn.—The citizens are reported to be considering the question of constructing a sewerage system.

**St. Paul, Minn.*—The Bd. of Pub. Wks. on July 8 awarded contract for sewer in Ottawa Ave. and in Sidney and King Sts. to D. W. Moore 902 Edmond St., for $10,397.

Two Harbors, Minn.—Frank Kempffer, Clk. of Dist. Court, writes that the citizens on July 9 voted to issue $40,000 bonds to complete the sewerage system.. Bids will probably be called for about Sept 1.

**Elbow Lake, Minn.*—Ilstrup & Olson, 220 Security Bank Bldg., Minneapolis, has secured the contract for constructing sewers and a septic tank (bids opened July 8), for $4,083.

Morris, Minn.—Bids will be received until Aug. 6 by the Common Council for constructing sewers in Dists. Nos. 4, 5, 8, 9 and 20. C. B. Burpee, City Clk.

Vicksburg, Miss.—Walter G. Kirkpatrick, of Jackson, is reported to have been selected to supervise the construction of sewers, to cost about $200,000.

Kansas City, Mo.—Bids will be received until July 23 by Bd. Pub. Wks. for furnishing material and constructing district sewers in Sewer Dist. Nos. 247, 215 and 15. E. A. Harper, City Engr.

Lewistown, Mont.—M. D. Kimball, City Clk., writes that bids will be received on Aug. 14 for the construction of 1½ miles of sewers; cost about $15,000. Engineer, O. F. Wasmendorff, of Lewistown.

Paterson, N. J.—The House on July 9 passed the bill authorizing Paterson to construct a sewage disposal plant.

Cape May, N. J.—Bids will be received until July 27 by the Cape May Real Estate Co. (Edmund K. Brown, Res. Engr.) for furnishing tools and laying 1,300 lin. ft. 18-in., 100 lin. ft. each of 24 and 12-in. terra-cotta pipe, and building 3 manholes and 6 catch-basins on Beach Ave., Cape May. All material for the work s furnished by the Real Estate Co.

Jersey City, N. J.—Bids will be received until July 22 by the Bt. Street and Water Comrs. (Geo. T. Bouton, Clk.) for constructing sewers in portions of several streets including Terrace Ave., Lincoln and Zabriskie Sts. Estimate of quantities: About 50 lin. ft. ea. of 36-in. and 30-in. brick circular sewer; 2,480 lin. ft. 18-in. vitrified pipe sewer; 500 cu. yds. of rock excav.; 40 cu. yds. of concrete; 70m ft. b. m. sheathing; 12 receiving basins and connections, etc.

Riverside, N. J.—The State Sewerage Comn. is reported to have approved plans for a sewerage system and sewage purification plant for the township of Riverside, Burlington County.

Silver City, N. M.—C. C. Whitehall, who recently secured franchise for sewerage system, writes that the proposed system will cost about $30,000.

Albuquerque, N. M.—City Engineer Gladden is reported to be completing plans for the sewerage system.

Buffalo, N. Y.—Bids will be received until July 26 by Francis G. Ward, Comr. Pub. Wks., for constructing 12, 15 and 18-in. tile sewers in portions of Richland and Durham Aves. and Jackson St.

New York, N. Y.—Bids were opened on July 3 by John F. Ahearn, Pres. Manhattan Boro., for sewers, and the following are the successful bidders:

*Vermilyea Ave. and Hawthorne St., Contract 6, successful bidders, Haggerty Constr. Co., 215 W. 125th St., as follows: 410 lin. ft. brick sewer 3 ft. 6 in. 2 ft. 4 in., $6.70; 130 lin. ft. brick sewer 3 ft. 6 in. 2 ft. 4 in., $8.85; 330 lin. ft. brick sewer 3 ft. 6 in. 2 ft. 4 in., $5.80; 394 lin. ft. brick sewer 3 ft. 6 in. 2 ft. 4 in., $7.93; 175 lin. ft. salt-glazed vitrt. stoneware pipe sewer 15 in., $2.50; 1,166 lin. ft. salt-glazed vitri. stoneware pipe sewer, 15 in., $4.30; 90 lin. ft. salt-glazed vitri. stoneware pipe culvert 12 in., $1.50; 4 receiving basins, circular, $150; 200 cu. yds. rock excav., 1 ct.; 1 M ft. timber and planking for bracing, 1 ct.; 4 M ft. timber and planking for foundations, 1 ct.

*Reconstructing outlet sewer under pier 58 North River, and in Marginal St. east side, between 14th and 18th Sts., with connections, Contract 2, successful bidder, Jos. Moore, 157 E. 89th St., as follows: 852 lin. ft. wooden barrel sewer 4 ft. 6 in., $13; 25 lin. ft. brick sewer 4 ft. 6 in., $18; 100 lin. ft. brick sewer 4 ft. 6 in., $22; 441 lin. ft. brick sewer 4 ft. 6 in., $17.50; 25 lin. ft. brick sewer 4 ft.x2 ft. 8 in., $18; 1,003 lin. ft. brick sewer 4 ft.x2 ft. 8 in., $13; 25 lin. ft. brick sewer 3 ft. 6 in.x2 ft. 4 in., $12.50; 114 lin. ft. salt-glazed vitri. stoneware pipe culvert 12 in., $2; 7 receiving basins, circular, $200; 10 cu. yds. old masonry excav., $5; 1.5 M. ft. of timber and planking for foundation, $40; total, $36,983.

Long Island City, L. I., N. Y.—The following are reported to be the bids opened on July 1 by Jos. Bermel, Pres. Queens Boro.. for (*a*) storm water sewer and appurtenances in Plaisance St., from Hunter's Point Ave. to Newtown Creek, 1st Ward: (*b*) Temporary sewer and appurtenaces in 3d Ave., 10th St. and 5th Ave., College Point, 3d Ward: John F. Clancy, *a*, $7,895; *b*, $14,535; Henry J. Mullin, *a*, $9,896; Hugh Hart, *a*, $9,319; Thos. F. Tuohy & Co., *a*, $12,645; *b*, $22,777; Peace Bros., *a*, $12,429; *b*, $20,397; Jos. A. Boyce, *a*, $10,538; *b*, $22,947; Gabriel Hill, *a*, $7,613; John J. Young, *b*, $17,061.

St. George, New Brighton, S. I., N. Y.—Bids will be received until July 30 by Geo. Cromwell, Boro. Pres., for furnishing material and constructing a combined sewer with appurtenances in a portion of Sewer Dist. No. 8 in the First Ward, to gether with work incidental thereto. Engineer's estimate: 71 lin. ft. of reinforced concrete storm water overflow chamber, including pile and timber foundation, 20 lin. ft. of 2 ft. 6 in. x 3 ft. 9 in. and 406 lin. ft. of 1 ft. 10 in. x 2 ft. 9 in. reinforced concrete sewer, interior diameter, all complete, as per section on plan of the work, 486 lin. ft. 20 in., 671 lin. ft. 18 in., 763 lin. ft. 15 in., 1,028 lin. ft. 12 in., 633 lin. ft. 10 in. and 120 lin. ft. 8 in. salt glazed vitrified pipe sewer, 17 manholes, complete, 4 M ft. yellow pine foundation timber and planking, 6 M ft. of spruce planking, in place and secured, 15 M ft. sheeting, etc.; also for furnishing material and constructing temporary sanitary sewers and appurtenances in portion of Newark Ave., together with the work incidental thereto. Engineer's estimate: 2,110 lin. ft. 8 in. and 2,643 lin. ft. 6 in. salt glazed vitrified pipe sewer, 24 manholes, 3 flush tanks with No. 5 Van Vranken siphon set, and connected with water main, 1 M ft. of foundation timber and planking, 1 M ft. of sheeting, retained, etc.

Brooklyn, N. Y.—Bids will be received until July 24 by Bird S. Coler, Boro. Pres., for furnishing material and constructing sewers in portions of several streets, including 100th, Bay 20th, 54th, Ten Eyck, Chester and E. 23d Sts., and sewer basins in several other streets. Engineers' estimate includes 45 lin. ft. 18-in., 1,298 lin. ft. 15-in., 3,761 lin. ft. 12-in. pipe sewer, 49,800 ft. sheeting and bracing, etc.; also 20 sewer basins.

Honeoye Falls, N. Y.—See "Water."

Amsterdam, N. Y.—Bids will be received until Aug. 2 by the Sewer Comrs. (A. T. Young, Secy.), for constructing sewers in portions of several streets including Arnold, Lincoln and McClellan Aves.

Shelby, N. C.—See "Water."

Chatham, Ont.—This city is reported to be applying to the Ontario Ry. and Municipal Board for permission to submit a by-law to the people, providing for an expenditure of $15,000 for extension of electric light system.

ELECTRIC RAILWAYS.

Notes Arranged Alphabetically by States.

Little Rock, Ark.—It is said that the Little Rock Ry. Co. (R. T. Baise, Ch. Engr.), will spend about $350,000 in betterments aside from equipment by the end of the present year if existing plans are carried out.

**Los Angeles, Cal.*—The Hueneme, Malibu & Port Los Angeles R. R. Co. is reported to have awarded contract to W. K. Peasley for the construction of 5 miles of railroad along the beach in the direction of Ventura.

Oakland, Cal.—It is reported that the City Council has granted to the Oakland Traction Co. a franchise for a single or double-track railway line in Lake Shore and Lake Park Aves., connecting with the Grand Ave. line.

**San Mateo, Cal.*—Peter Thorsen and J. Johns, of the San Mateo Constr. & Contr. Co. are stated to have petitioned the Bd. of Trustees for a franchise to operate electric cars in the town and to Burlingame by means of the underground conduit system. The name of the company is to be the People's Ry. Co.

Bridgeport, Conn.—A resolution incorporating the Bridgeport & Danbury Electric Ry. to build an electric road in Connecticut is stated to have been passed by the Legislature. Capital, $1,500,000.

Atlanta, Ga.—A charter is stated to have been granted by the Secretary of State to the Tennessee & Georgia Interurban Ry. Co. The proposed line starts at Rossville and runs through Chickamauga Park to Ringgold and Catoosa Springs, a distance of about 25 miles. Capital, $500,000. Incorporators: Jas. C. Bryan, Jas. L. Jones, W. E. Biggers, W. H. Paine, Jr., Chattanooga, and others.

Tifton, Ga.—The City Council is reported to have granted a franchise to L. P. Thurman, L. W. Myers, W. W. Banks, O. Daniel, J. E. Cochran, F. F. Bussey and J. J. L. Phillips to construct, own and operate an electric line through the principal streets of Tifton.

Brunswick, Ga.—See "Power Plants, Gas and Electricity."

Chrisman, Ill.—The City Council is reported to have granted a franchise to the Paris & Northern Ry. Co. The road will enter the city on McKinley and follow Illinois St. to the city limits.

Evanston, Ill.—The Evanston Council is stated to have granted a franchise to the Chicago Consolidated Traction Co. (J. M. Roach, Gen. Mgr., Chicago), to extend its tracks in North Evanston.

Chicago, Ill.—The Council is reported to have passed the Milwaukee & St. Paul ordinance. It allows the railroad to electrify its Evanston branch north of Wilson Ave. so as to carry the cars of the Northwestern Elevated to the city limits.

Gary, Ind.—The Town Bd. is reported to have granted a franchise to Frank Gavitt and associates, of Whiting, for street railway lines on Broadway, 5th and 11th Aves., in this city.

Indianapolis, Ind.—The Indianapolis Traction & Terminal Co. (Thos. B. McMath, Ch. Engr.), is stated to have secured additional property joining the terminal station, which completes the possession of the entire square. The company will erect thereon additional train sheds, an express depot and additional freight houses.

Columbus, Ind.—After considering a petition of the Indianapolis, Columbus & Southern Traction Co. (A. A. Anderson, Gen. Mgr.), for a franchise over 2d St., the City Council granted the same.

Sapulpa, Ind. Ter.—The citizens of Sapulpa are stated to have closed a deal with E. C. Reynolds to build an electric railway in Sapulpa and to the oil fields southeast of here.

**Atlantic, Ia.*—The Atlantic, Northern & Southern R. R. Co. is stated to have awarded the contract for the grade work on the new railroad to Tompkins to Fitzgerald & Peterson, of Omaha, Neb., at 18 cts. per cu. yd.

Brunswick, Md.—The Town Council is stated to have granted a franchise for the use of certain streets of the town to the Brunswick & Middletown Ry. Co. It is the intention of the company to build an electric line from Brunswick to Middletown by way of the "Maryland Tract," which will intersect the Frederick & Middletown line at Middletown.

**Mankato, Minn.*—It is stated that the Knox Constr. Co., of Chicago, will build the line for the Mankato Electric Traction Co.

* *Items marked thus give the names of parties awarded contracts.*

Hattiesburg, Miss.—See "Power Plants, Gas and Electricity."

New Brunswick, N. J.—The County Freeholders are stated to have on third final reading the ordinance giving the Jersey Central Traction Co. (F. L. Bangs, Supt., Keyport) the right of way over the county bridge across the Raritan, between South Amboy and Perth Amboy, thus giving the company entrance to Perth Amboy.

Jamestown, N. Y.—It is reported that the Chautauqua Traction Co. (C. J. Griffith, Ch. Engr.), will soon begin double-tracking its entire line from Jamestown to Westfield.

Greece, N. Y.—The Rochester Ry. Co. (R. E. Danforth, Gen. Mgr., Rochester), is stated to have received from the Highway Comn. of Greece a franchise to lay a double-track electric railway from the intersection of Lake Ave. and the Ridge Rd. along the middle of the Ridge Rd. to the tracks of the New York Central's Charlotte branch.

Oneida, N. Y.—It has been definitely announced by the Utica & Mohawk Valley Ry. (C. L. Allen, Gen. Mgr., Utica) and all the other electric systems in Central New York that the Andrew-Vanderbilt syndicate would build an electric road from Rome to Oneida. Franchises have already been secured and plans made for the route. It is expected that the new line which the Andrews-Vanderbilt interests propose to build will follow the route laid out by the defunct Rome & Oneida Ry. Co.

Oklahoma City Okla.—It is stated that the Oklahoma City St. Ry. Co. (Chas. W. Ford, Gen. Supt.), will erect its own power house and expend about $175,000 in the installment of machinery and the erection of the building. The dimensions of the structure will be 96x103 ft.

Freeland, Pa.—The Lehigh Traction Co. (A. Markle, Gen. Mgr.), Hazelton), is reported to have decided to extend the trolley tracks to Front St. It was also decided to erect a freight station on Centre St. between the Lehigh Valley station and Front St.

Dauphin, Pa.—The Borough Council is stated to have granted the right of way to the Central Pennsylvania Traction Co. (W. J. Calder, Secy., Harrisburg), to enter the borough. The consent of the abutting property owners must also be secured, and as soon as this is done the company will then extend its line from Rockville to Dauphin.

Carmichaels, Pa.—The Council is stated to have granted a franchise to the Masontown, Smithfield & Brownsville St. Ry. Co. The course of the road is not yet decided upon, but engineers will be put to work immediately and lines will be run from Masontown to Carmichaels, then by way of Jefferson to Waynesburg; also from Carmichaels through Clarksville and Zollarsville, thence via Ellsworth to the river. It is the intention of the company to eventually reach Pittsburg.

Ring, for both 2 and 4-story buildings, at $2,615 and $2,665, respectively; heating, the Modern Heating Co., 213 Chestnut St., $6,990 upon the 4-story building; and The J. B. Hughes Heating Co., 1234 Clark Ave., at $3,100 on the 2-story building.

Newark, N. J.—Bids will be received until 4.30 P. M. July 25 by Com. on Schoolhouses Bd. Educ. (R. D. Argue, Secy.), for erecting Lincoln School. Bids to be submitted separately on the following: Mason and fireproofing work, iron and steel work, carpenter work, plumbing work, roofing and cornice work, electrical work, ventilating and heating system, motor and motor wiring.

Plans are stated to be in preparation for a 12-room addition to Belmont Ave. school and a 12-room addition to Bergen St. school.

Phillipsburg, N. J.—The Bd. of Educ. has decided to expend $60,000 in providing additional school room.

Jersey City, N. J.—Supt. of Schools Henry Schnyder, in his annual reports, recommends erecting a new building to replace School No. 3 and an addition to School No. 15.

**Geneva, N .Y.*—It is stated that the contract to erect the Wm. Smith Hall of Science at Hobart College has been awarded to A. B. Morrison, of Geneva, at about $70,000.

**Brooklyn, N. Y.*—The following are the bids opened in July 8 by C. B. J. Snyder, Supt. School Bldgs., N. Y. City, for general construction, etc., of School 157, Boro. of Brooklyn: Peter Cleary, 195 Bainbridge St., $411,900 (awarded contract); P. S. Brennan & Son, $433,000; John Auer & Sons, $418,299; Richd. E. Henningham, $417,824; P. Gallagher, $424,983; Wm. Werner, $462,800.

*The following are the bids opened same time and place for installing, ventilating and heating apparatus, in School 94, boro. of Brooklyn: Baldwin Eng. Co., $46,900; E. Rutzler Co., $43,435; Blake & Williams, $34,961, and Frank Dobson Co., Inc., $34,246 (awarded contract).

**Richmond, S. I., N. Y.*—The following are the bids opened on July 8 by C. B. J. Snyder, Supt. School Bldgs., N. Y. City, for general construction, etc., of School 28, in Richmond, Boro. of Richmond: Ph. Wolff & Son, $45,882; Laurence J. Rice, 208 Bway., N. Y. City, $38,663 (awarded contract); The Dottsford Dickenson Co., $40,875; J. MacArthur, $39,000; Jos. Ohlhausen, $43,400.

Ogdensburg, N. Y.—Geo. Hall, of Pasadena, Cal., is reported to have given this city $100,000 for the erection of a seminary.

Binghamton, N. Y.—Plans for the Fairview School, it is stated, have been accepted, and A. J. Inloes, Secy. Bd. Educ., has been authorized to receive bids for construction.

New York, N. Y.—C. B. J. Snyder, Chf. Archt. of the Dept. of Educ., has filed plans for a second enlargement of old Rivington St. School No. 4, by the addition of a new 5-story annex, 125x100 ft. The improvements are to cost $180,000.

Albany, N. Y.—Bids as a whole will be received until Aug. 15 by Dr. Andrew S. Draper, State Comr. of Educ., Albany, for the construction of the N. Y. State Normal College at Albany, including heating, plumbing, electric work and gas pipiing.

Nyack, N. Y.—Bids will be received by E. S. Van Houtes, Pres. Bd. of Educ., until July 29, for erecting a new school and remodeling present school of the Union Free School Dist. 4, Orangetown, Nyack, as advertised in The Engineering Record. Bids may be submitted for the entire work or for carpenter work, mason work, plumbing or heating and ventilating separately.

**Fargo, N. D.*—The following are reported to be the bids received July 5 for installing a ventilating and heating system in the high school and central building, (*a*) Warner-Webster system; (*b*) Van Auken: T. P. Riley, *a* $9,000, *b* $8,756; E. J. Harrington, *a* $8,749, *b* $8,300; Fargo Plumbing & Heating Co., *a* $8,110, *b* $7,990 (awarded contract).

Bottineau, N. D.—The School of Forestry Bd. is reported to have awarded the contract for the new building to Edmund White, of Bottineau, for $24,200.

Minot, N. D.—It is reported that bids will be received until Aug. 3 for the erection of a 4-room addition to the Central School, including ventilating and heating. Frost & Hosmer, archts.

Granville, N. D.—Bids will be received until Aug. 6 by Bd. Directors of Granville School Dist. No. 25 for erecting a 4-room brick school. Wm. Zimmerman, archt., Minot; W. G. Morrison, Dist. Clk.

Hannaford, N. D.—It is reported that bids will be received until about Aug. 4 by the Bd. of Educ. (A. C. Anderson, Clk.) for erecting a school. Thori, Alban & Fisher, of St. Paul, Minn., are the archts.

Kenmare, N. D.—It is stated that bids will be received until Aug. 1 by Frost & Hosmer, Blaisdell-Bird Bldg., Minot, for erecting a high school to cost about $20,000.

Columbus, O.—Bids will be received until Aug. 5 by Com. on Bldgs., Bd. Educ. (C. E. Morris, Chmn.) for furnishing material and excavating and putting in the foundation for a 21-room school to be erected at Indianola and 16th Aves.

Crown Point, O.—Bids will be received until July 30 by I. A. Seybold, Clk. Madison Township, at Trotwood, for erecting a school in Crown Point, in Madison Township

Mingo, O.—It is stated that bids will be received until July 26 by C. L. Reed, Clk. Bd. Educ., for erecting a school.

Glassport, Pa.—Bids will be received until Aug. 5 by the School Bd. (Boyd Wilson, Secy.), for $50,000 bonds.

Harrisburg, Pa.—A. A. Ritcher, of Reading, is said to be preparing plans for Sunday school building for the United Brethren Church. Estimated cost $40,000. Address pastor.

Waynesburg, Pa.—At a meetiing of the Trus. of Waynesburg College, July 8, according to reports, it was decided that the $15,000 appropriation by the last Legislature be used in erecting a 3-story brick dormitory for women.

Rumford, R. I.—H. B. Smith Co., of Providence, it is stated, has been engaged to prepare plans for the heating plant which is to be installed at the Union Grammar School and for which $1,500 has been appropriated.

Cranston, R. I.—It is stated that all bids received July 1 for erecting several schools have been rejected.

Allendale, S. C.—The erection of a $20,000 school is reported under consideration.

**Aberdeen, S. D.*—The School Bd. is stated to have awarded to C. Lepper the contract to erect the school on the west side at $11,745.

Irwin D. Aldrich, of Big Stone, Secy. Bd. of Regents of Educ., writes that bids will be received by the Bd. of Regents at Spearfish until about Aug. 20 for the erection of a normal school at Aberdeen; cost reported to be about $58,000. Architect, Wm. M. Kenyon, Guaranty Bldg., Minneapolis, Minn.

North Athens, Tenn.—Reports state that Harper College, 4-story brick building, in North Athens, owned by U. S. Grant University, of Athens, wa sstruck by lightning on July 10 and totally destroyed by fire.

Dayton, Tenn.—It is stated that Bearden & Foreman, of Chattanooga, are preparing plans for a $15,000 school.

Athens, Tenn.—Adams & Alsup, of Chattanooga, are stated to be preparing plans for a school to be erected here at a cost of $15,000.

**Knoxville, Tenn.*—It is reported that Brimer & England have the contract for erecting a school on Gratz St. at $21,900.

Chattanooga, Tenn.—The Bd. of Aldermen has passed a resolution providing for the erection of 3 schools at a cost of $160,000.

Chilocco, Okla. Ter.—Bids will be recetved until Aug. 5 by S. M. McCowan, Supt. Chilocco, for furnishing and delivering at the Indian School as required during the fiscal year ending June 30, 1908, about 33,000 ft. of lumber, 15,500 shingles, 78 windows, doors and transoms, 12,400 laths, 275 sq. yds. metal laths, 4,000 brick, 610 ft. window guards, 2 iron stairways complete, 20 squares tin roofing, some bath tubs, sinks, closets, etc., about 890 ft. of valley, gutter, spouting, etc.

**Childress, Tex.*—E. T. S. Williams, of Childress, is reported to have secured the contract to erect a school estimated to cost $15,000.

Arlington, Tex.—The School Bd., according to reports, has decided to erect a $15,000 school. Address Clk. of the Bd.

Cleburne, Tex.—It is reported that arrangements are being made to erect a $75,000 school. Address Prof. G. G. Hall.

College Station, Tex.—Plans and specifications will be received, bids to be opened by the Bd. of Directors of the Agricultural & Mechanical College at Oriental Hotel, Dallas, at 9 A. M. Aug. 3, for the following buildings: At College station: dormitory, $45,000; bath house, $9,000; veterinary hospital, $4,500; at Prairie View: dormitory, $15,000. For information address Chas. Puryear, Dean, College Station.

**San Marcos, Tex.*—J. M. Carroll, Agent and Pres. San Marcos Baptist Academy, writes that the contract for erecting building for the academy (bids opened July 6), has been awarded to Fischer & Lambie, of Austin, for about $107,000.

Uvalde, Tex.—It is reported that a high school will be erected at a cost of $40,000. Adress Clk of School Bd.

Prairie View, Tex.—The Bd. of Directors of the Agricultural College, it is reported, has appropriated $30,000 for improving the Prairie View Branch of the Industrial College.

Weatherford, Tex.—It is stated that a dormitory is to be erected at the Texas Female Seminary to cost $22,000.

Scofield, Utah.—Bids will be received until July 25 by the Bd. School Trus. (F. H. Merreweather, Chmn.) for erecting an 8-room brick school. Bids to be submitted as a whole or separately on the following: Excavation, stone, cement, concrete and brickwork, carpentry, including tin, wrought iron and galvanized ironwork, cement work. Separate bids will be received for heating apparatus.

**Pullman, Wash.*—The Bd. of Control, it is stated, has awarded to A. Valk, of Pullman, the contract

* *Items marked thus give the names of parties awarded contracts.*

to erect the domestic science building at the State College at Pullman to include heating, plumbing and wiring at $23,729; also the contract to erect the veterinary hospital including plumbing, heating and wiring at $10,450.

**Tacoma, Wash.*—John Huntington, it is stated, has been granted a permit to erect the Rogers School on East M and 34th Sts. The structure will be of concrete and 2 stories high, contain 12 school rooms and cost $50,000.

Benton, Wis.—The electors of Dist. No. 1, it is reported, have decided to issue $20,000 bonds for a school H. L. Winskell, Pres. Bd.

Edgerton, Wis.—Florence Child, according to reports, has presented the city $40,000 to be used for the erection of a new high school.

Galesville, Wis.—Schick & Roth, of La Crosse, are reported to have prepared plans for a 2-story brick school to cost $20,000.

West Allis, Wis.—Plans for the $18,000 school for West Allis are being prepared, according to reports, by Chandler & Park, Racine.

Arcadia, Wis.—Schick & Roth, of La Crosse, it is reported, have completed plans for a $20,000 high school to be erected here.

Milwaukee, Wis.—Leehouts & Guthrie, 102 Wisconsin St., it is stated will prepare plans for the fan system of ventilating for the 10th Dist., No. 1, and 11th Dist., No. 1, Schools.

**Oshkosh, Wis.*—J. W. McAllister & Co., of Oshkosh, is reported to have secured the contract for the plumbing and piping in the Read School at $4,000, and the Dukerschein Htg. & Ventilating Co., the contract for the ventilating and heating, at $4,478.

Toronto, Ont.—Bids will be received until July 23 by W. C. Wilkinson, Secy.-Treas. Bd. Educ., for enlarging Grace St., Pape and Perth Aves. schools, alterations to Jarvis St. Collegiate Inst. and other repairs.

STREET CLEANING AND GARBAGE DISPOSAL.

Notes Arranged Alphabetically by States.

Des Moines, Ia.—Warren Walker, Secy. Engle Crematory Co., writes that it is proposed to construct a plant for the utilization and disposal of garbage, dead animals, etc., at a cost of $25,000. Plans are not yet fully completed.

Baltimore, Md.—Bids will be received until July 24 by the Bd. of Awards (J. Barry Mahool, Pres.) for the removal by scow or lighter, and final disposition of street sweepings and other refuse. J. L. Wickes, Comr. Street Cleaning.

**Hattiesburg, Miss.*—Lewis & Kitchen, 433 Wabash Ave., Chicago, Ill., are reported to have on July 5 secured the contract for constructing municipal garbage crematory for $9,960.

Schenectady, N. Y.—The Bd. of Contract and Supply on July 10 rejected the two bids opened on June 26 for the collection and sanitary disposal of ashes, rubbish, garbage and dead animals of the city for 5 years, beginning Oct. 1, 1907. L. B. Sebring, City Engr., Parker Bldg.

Hornell, N. Y.—The question of constructing a garbage crematory is reported under consideration here.

Columbus, O.—Engineer John H. Gregory is reported to have filed with the Bd. of Pub. Service on July 12 specifications for a garbage reduction plant of 100 tons capacity for 24 hours at an estimated cost of $150,000; also a furnace for incinerating rubbish in addition to the garbage reduction. The Rapp and Schwenker farm is stated to have been selected as the site for the plant.

Youngstown, O.—We are informed that a new ordinance is now being considered by City Council for disposal of garbage for 5 yrs. New bids will be called for later Clate A. Smith, Secy. Bd. of Health.

NEW INDUSTRIAL PLANTS.

See also "Business Buildings."

Montrose, Colo.—O. C. Skinner and Geo. Truesdale are reported interested in a company which has been organized for the purpose of erecting a factory to manufacture ice. The plant will cost about $30,000 and will have ten tons' daily capacity and the storage warehouse will hold 50,000 cu. ft. of refrigeration.

Peoria, Ill.—The plant of the Independent Cereal Milling Co is reported to have been purchased by the Corno Milling Co., of East St. Louis, and it is said to be the intention of the new owners to spend $50,000 at once in the erection of an elevator and an addition to the present plant in the Galena Road in Averyville, and the installation of necessary equipment for the prospective increased output.

Boston, Mass.—It is reported that the Foss Cotton Mills intends erecting cotton mills in East Boston at a cost of about $2,500,000.

Willmar, Minn.—The Great Northern Ry. Co. (A. H. Hogeland Ch. Engr., St. Paul), is reported to have purchased a site in the east end of this city on which a locomotive machine shop will be built. The roundhouse will also be enlarged. A new 100-ft. turntable will take the place of the one now in use.

**Minneapolis, Minn.*—It is reported that the Flour City Ornamental Iron Wks has let the contract to J. L. Robinson for its new brick and steel foundry to be erected at 27th Ave. S. and 27th St. The structure will be 75x200 ft., and cost complete $25,000.

New York, N. Y.—Bids will be received until July 31 by Wm. S. Patten, Asst. Q. M. Gen., U. S. A., Depot Q. M., 39 Whitehall St., New York City, for furnishing and delivering alongside of vessel within reach of ship's tackle, in the harbor of New York, a complete ice making and distilling plant.

Double Shoals, N. C.—The Double Shoals Cotton Mills, it is stated, will expend $20,000 for new machinery. This company is now operating 3,000 spindles, and it is reported to be preparing to establish a plant for manufacturing bricks for the erection of an addition.

Sidney, O.—The plant of the American Scraper Co. is reported to have been seriously damaged by fire on July 9.

Philadelphia, Pa.—Ballinger & Perrot, 102 S. 12th St., it is stated, have completed plans and invited estimates for the erection of 2 buildings for the Columbia Mills, at Fifth St. and Columbia Ave. One of the buildings will be 32x35 ft., and will be 4 stories and basement high; the other, 48x76 ft., one story and basement. Both buildings will be of brick, with slag roofs, and will have columns, floors and roofs of slow-burning wood construction.

The Miller Lock Co. has purchased a site at Tacony and Duncan Sts. and intend erecting a 2-story brick and stone fireproof lock factory 220x195 ft. Plans have been prepared by Heacock & Hokanson, 931 Chestnut St.

Permits have been granted to Cramp & Co., Commonwealth Bldg., for the erection of 2 buildings for manufacturing purposes, to be built at 5th and Appletree Sts., for the Smith, Kline & French Co., will be a 6-story concrete, brick and terra cotta structure, 91x61 ft., and cost $100,000. The other for the New York Pie Baking Co., to be erected at Lombard and 25th Sts., will be 2 stories high, 131x74 ft., of fireproof construction with an exterior facing of brick and cost $40,000. Plans for both buildings were drawn by Ballinger & Perrot, 102 S. 12th St.

Pittsburg, Pa.—It is reported that the Pittsburg Steel Co. will issue $4,000,000 bonds for improvements and extensions to the plant.

The Warner Glass Co., it is reported, is planning the enlarging of their plant this summer by the addition of a 6-ring continuous tank, which will give employment to 12 more shops.

Ashaway, R. I.—The Ashaway Clay Co. is reported formed with Geo. L. Babcock, of Plainfield, N. J., Pres., and Frank Hill, of Ashaway, Secy., and a capital of $50,000, for the purpose of building a plant to manufacture high-grade face brick having a capacity of 20,000 bricks per day.

**Chattanooga, Tenn.*—Adams & Sneider, 120 E. 8th St., are reported to have the contract to build a foundry for the American Brake Shoe Co. Estimated cost $40,000.

Spokane, Wash.—The Ford Pump & Engine Co., according to reports, is being organized with head offices in Spokane. The new organization has the patent for a rotary engine and pump, and is contemplating the erection of a factory in Spokane for manufacturing the engines and pumps. Capital, $100,000. Officers: A. F. Ford, Pres.; J. B. Ferguson, Vice-Pres.; B. L. Youngs, Secy. and Treas.

Everett, Wash.—It is stated that the Stetson Post Co. intends erecting mills here at a cost of about $1,000,000. H. A. Chase, of Everett, may be able to giive further information.

Tacoma, Wash.—A permit has been granted to the Northern Pacific Ry. Co. (W. L. Darling, Ch. Engr., St. Paul, Minn.) for a 100x186-ft. addition to the machine shops at South Tacoma, a blacksmith shop and for a storage building 28x176 ft. The total cost of the 3 structures will be $125,000.

Elm Grove, W. Va.—The Wheeling Enameled-Iron Co., it is stated, will double the capacity of its plant at Elm Grove, and $60,000 will be expended in the general improvements. An additional foundry building 110x63 ft. will be erected adjoining the present one, and will be almost entirely of steel frame construction. The contract for the steel frame material and the steel construction work is reported awarded to the Riverside Bridge Co., of Martins Ferry, and contracts for other work in connection with the improvement have been let to local contracting firms.

Milwaukee, Wis.—Plans have been filed by the Schlitz Brewing Co. for a brewhouse, mill and boiler house to be erected on 2d and Cherry Sts., according to plans by Louis Lehle, of Chicago, Ill., and to cost $300,000.

A building permit is reported issued for a factory and warehouse for the William Berger Bedding Co., to be erected at a cost of $75,000 at Florida and Grove Sts.

**La Crosse, Wis.*—The Foster Construction Co., Empire Bldg., Milwaukee, it is stated, has been awarded the contract for the new Listman mill to be erected at La Crosse. The building will be 6 stories high, of brick and concrete construction.

Walkerville, Ont.—It is stated that application has been made for a charter for the Ontario Structural Steel Co., which expects to erect a plant in Walkerville and employ 500 men. An option has been obtained on a site of 20 acres. The principal steel goods to be manufactured will be structural steel for bridges, sky scrapers and other structural purposes. The promoters of the new company are said to be Henry Drake and Herman Schwein, formerly with the Canadian Bridge Co.

Toronto, Ont.—The Lautz Marble Company, of Buffalo, N. Y., are said to be locating a plant at Toronto. Negotiations are practically completed for a large property in the East End, near the railway tracks. A building, over 200 ft. long, and to cost $40,000, will be built.

Henry Simpson, archt. of Toronto, it is stated, will build a $50,000 factory on site of old Parliament St. School for the Aluminum & Crown Stopper Co. The building will be of mill construction, and 5 stories high.

Stratford, Ont.—It is stated that the Grand Trunk Ry. (Jos. Hobson, Ch. Engr., Montreal, Que.), are to rebuild their Stratford car shops on a large scale. The new shops will be 95x175 ft., and will be run with electricity throughout. One large 120-ton crane will be installed.

Brantford, Ont.—The Ham & Nott Mfg. Co., it is reported, has temporarily abandoned the plan of a branch plant in Ottawa, and will enlarge the local factory at a cost of $40,000.

MISCELLANEOUS.

Notes Arranged Alphabetically by States.

**Pine Bluff, Ark.*—The Dirs. of the Consot Drainage Dist. are reported to have awarded to G. A. McWilliams, of Peoria, Ill., the contract for constructing about 16 miles of drainage canal (bids opened July 2) at 9 cts. per cu. yd. for the main work and 10.25 cts. for the laterals; total cost, about $50,000. Engineer, Willis E. Ayres, Randolph Bldg., Memphis, Tenn.

Oroville, Cal.—The City Council is reported to have adopted the plans of Engineer Hall for flood protection from Feather River. The plans are said to call for a concrete wall, 6 ft. wide at bottom, and 18 in. on top, to cost about $100,000.

Wilmington, Del.—Bids will be received until Aug. 5 by Maj. C. A. F. Flagler, Corps. Engrs., U. S. A., Wilmington, for dredging Salem River, N. J.

Washington, D. C.—Bids will be received by Maj. Spencer Cosby, Corps Engrs., U. S. A., until Aug. 12, for dredging in Potomac and Anacostia Rivers, near Washington, as advertised in The Engineering Record.

Bids will be received until July 23 by the Bureau of Supplies & Accounts, Navy Dept., Washington, for furnishing at the various navy yards and naval stations the following supplies; Portsmouth, N. H., Schedule 45—Milling machine, hydraulic accumulator. Schedule 80—Asbestos packing. Boston, Mass., Schedule 76—Bolts and nuts, screws, pulleys, drills, shovels, files, etc. Schedule 78—Sheet brass and copper, rolled bronze. Schedule 79—Bar iron and steel, galvanized sheet steel, slab zinc, pig lead. Schedule 82—Copper pipe, pipe fittings, valves. Schedule 83—Insulating tape. New York, N. Y., Schedule 76—Bolts and nuts, brass nuts, steel wire and copper nails, scrapers, etc. Schedule 78—Sheet brass. Schedule 79—Sheet lead, steel billets, bars and angles, sheet tin. Schedule 81—Cement compound, etc. Schedule 82—Iron or steel pipe, pipe fittings, gate valves. Schedule 84—Iron castings. Washington, D. C., Schedule 71—Valves, etc., ties, brass and copper tubing, etc., steel tubes, gauges. Norfolk, Va., Schedule 73—Fire brick, steel letters, sheet steel, etc. Schedule 76—Copper and phosphor-bronze wire, bolts and nuts, drills, files, etc. Schedule 78—Rolled bronze, sheet brass. Schedule 79—Galvanized sheet steel. Schedule 82—Brass pipe, brass pipe fittings, valves. Schedule 85—Contruction of wards at naval hospital. New Orleans, La. Schedule 45—Steam hammer, blower, melting furnace. Newport, R. I., Schedule 41—Connection of officers' quarters with steam distributing lines. Schedule 42—Alterations to building. Schedule 72—Motor drive outfits at the navy yard, Charleston, S. C. Applications for proposals should designate the schedule desired by number. E. B. Rogers, Paymaster Gen., U. S. N.

**Fernandina, Fla.*—Bids were opened on July 1 by Lieut.-Col. Dan. C. Kingmen, Corps Engrs. U. S. A., Savannah, Ga., for dredging harbor at Fernandina, about 525,000 cu. yds. *a* price per cu. yd., *b* totals: P. Sanford Ross, Inc., Jersey City, N. J., *a*, 19.75 cts.; *b*, $103,687. Roderick G. Ross, Jacksonville, Fla., *a*, 20 cts.; *b*, $105,000. North American Dredging Co., Brunswick, Ga., *a*, 17.75 cts.; *b*, $93,187 (awarded contract).

Tampa, Fla.—Bids will be received by Maj. Francis R. Shunk, Corps Engrs., U. S. A., Jacksonville, until Aug. 16 for dredging in Tampa Bay, Fla., as advertised in The Engineering Record.

Joliet, Ill.—See "Power Plants, Gas and Electricity."

Rock Island, Ill.—The Drury Drainage Dist. (Wallace Treichler, Engr.) will, on July 30, let contract for 312,000 cu. yds. levee work, and 192,000 cu. yds. ditch work.

**Chicago, Ill.*—The contract for three 5-ton power stiff-leg derricks (bids opened July 8), has been awarded to J. E. Roemheld, Chamber of Commerce Bldg., for $8,450.

Bids will be received until July 23 by John J. Hanberg, Comr. of Pub. Wks., for furnishing apparatus and dredging approximately 8,500 cu. yds. of material from the bottom of slip "A" of the west fork of the south branch of Chicago River.

Piper City, Ill.—Bids will be received by the Comrs. of Vermilion Special Drainage Dist. at the First Natl. Bank Bldg., Piper City, until July 31 for 44,450 cu. yds. of dredge or machine ditch work and 62,460 cu. yds. of scraper ditch work, as advertised in The Engineering Record.

Sullivan, Ind.—It is stated that bids will be received until Aug. 5 by W. H. Jones, Jr., Engr. and Supt., New Lebanon, Ind., for constructing a dredge boat ditch, about 80,000 cu. yds.

Muskogee, Ind. Ter.—Bids will be received until July 27 by J. Geo. Wright, Comr. of Five Civilized Tribes, Muskogee, for drilling apparatus as follows: 2,000 ft. single cylinder, hydraulic-feed diamond-core drill with 12-in. run, drilling capacity 2,000 ft.; a 800 ft. single cylinder hydraulic-feed diamond-core drill, 12-in. run, drilling capacity of 800 ft.

Des Moines, Ia.—We are informed that no bids were received on July 10 by the Bd. of Pub. Wks. (W. W. Wise, Chmn.) for improvement of the channels of Raccoon and Des Moines Rivers. Matter may now be postponed for some time. Geo. D. Dobson, City Engr.

Muscatine, Ia.—It is stated that bids will be received until Aug. 5 by A. S. Lawrence, Co. Aud., for constructing a ditch in Drainage Dist. No. 4.

Dakotah, Ia.—It is stated that bids will be received until July 25 by John Cunningham, Co. Aud., for constructing a ditch or drain in Humboldt Township.

**Boone, Io.*—The contract for constructing county drain No. 37 (bids opened July 8), has been awarded to Fehlersin & Rosackerhler Co., of Boone, for tile, $1,860, and Chas. Peterson, for digging, about $1,260.

**New Orleans, La.*—Christie & Lowe, 107 Camp St., are reported to have secured the contract for constructing sill across Cubits Gap and The Jump, and placing additional mattresses on sill across head of Pass-a-Loutre, Mississippi River (bids opened July 6 by Col. E. H. Ruffner, Corps Engrs., U. S. A., Room N, Custom House) for about $242,000.

Boston, Mass.—The lowest bid opened on June 29 by Maj. Edw. Burr, Corps Engrs. U. S. A., for dredging under continuing contract a 35-ft. channel in Boston Harbor, was submitted by G. H. Breymann & Bros., of Toledo, O. They bid for Sections 5, 6, 7 and 8, 22 cts. per cu. yd. for dredging and $12 per ton for bowlders, and for Sects. 5a, 6a, 7a and 8a, 40 cts. per cu. yd. for dredging and $24 per ton for bowlders.

The Bd. of Aldermen on July 1 passed the loan bill providing $272,500 to the Park Dept. and $24,500 to the Public Grounds Dept.

Bids will be received at the office of the Charles River Basin Comn., 367 Boylston St., until Aug. 5 for building a portion of Cambridge marginal conduit, requiring approximately 2,000 cu. yds. concrete masonry, 40,000 lin. ft. piles and excav. and refill of about 1,900 lin. ft. trench, as advertised in The Engineering Record.

Bids will be received by the Bd. of Harbor and Land Comrs. until Aug. 2 for enlarging and extending the stone jetties at Cuttyhunk harbor, in Gosnold, and excavating a portion of Rock creek, in towns of Eastham and Orleans, as advertised in The Engineering Record.

**New Bedford, Mass.*—The following are the bids opened on July 6 by Lieut.-Col. J. H. Willard, Corps. Engr., U. S. A., Newport, R. I., for dredging in New Bedford and Fairhaven harbors, Mass. (Price given per cu. yd.): Columbia Dredging Co., New York, N. Y., 13.74 cts.; Morris & Cumings Dredging Co., New York, N. Y., 15.9 cts.; International Contr. Co., New York, N. Y., 17.5 cts.; Chas. M. Cole, Fall River, Mass., 14.5 cts.; J. S. Packard Dredging Co., Providence, R. I., 14.9 cts.; Eastern Dredging Co., Boston, 15.6 cts.; Coastwise Dredging Co., Norfolk, Va., 12.7 (recommended for award); Maritime Dredging Co., New York, N. Y., 13 2-5 cts.

**Saugatuck, Mich.*—Bids were opened on June 24 by Col. M. B. Adams, Corps, Engrs., U. S. A., Grand Rapids, for construction of sheet pile revetment and repair of South Pier at Saugatuck Harbor, Mich. The bid of Robt. Love, of Muskegon, has been recommended for acceptance at the following bid: 96 lin. ft. cut down and remov old work, $2; 25,556 lin. ft. oak piles, 36 cts.; 27.041 M ft. oak timber, $65; 319.077 M ft. pine or Douglass fir timber, $46; 516.034 M ft. pine or Douglas fir plank for sheet piles, $49; 21.952 M ft. pine or Douglas fir plank for decking, $45; 39,354 lbs. drift bolts, 4 cts.; 20,318 lbs. screw bolts, 4 cts.; 22,795 lbs. tie rods, 4 cts.; 15,705 lbs. carriage bolts, 5 cts.; 1,716 lbs. spikes, 4 cts.; total, $56,254. Totals of other bids: Burk, Smith & Nelson, Muskegon, $56,967; G. W. Bunker & Co., Grand Rapids, $59,688; Bennett-Schnorbach Co., Muskegon, $65,717; Great Lakes Dredge & Dock Co., Chicago, Ill., $70,025.

Cheboygan, Mich.—Bids will be received by Col. Chas. E. L. B. Davis, Corps Engrs., U. S. A., Detroit, until Aug. 15 for dredging harbor at Cheboygan, as advertised in The Engineering Record.

**Duluth, Minn.*—Bids were opened on June 28 by Maj. Graham D. Fitch, Corps Engrs., U. S. A., for dredging in harbor of Duluth, and the Duluth-Superior Dredging Co., of Duluth, secured the contract at the following bid: Duluth Canal, 35,000 cu. yds., 25 cts. per cu. yd.; St. Louis Bay, 335,000 cu. yds., 10 cts.; Nemadji River, 550,000 cu. yds., 10 cts.; Superior Entry, 80,000 cu. yds., 25 cts.; total, $117,250. Totals of other bids received: Great Lakes Dredge & Dock Co., Chicago, Ill., $124,775; Zenith Dredge Co., Duluth, $134,687; and Northern Dredge Co., Duluth, $142,475.

Alexandria, Minn.—Bids will be received until July 29 by E. P. Wright, Co. Aud., Alexandria, for digging and constructing the main ditch, branches and forks of County Ditch No. 13, containing approximately 41,029 cu. yds. excav. and estimated to cost a total of $5,129.

Clarksdale, Miss. Bids will be received until July 29 by the Levee Bd. (T. G. Dabney, Ch. Engr.), Clarksdale, for the following levee work: Enlargement, Sections 1 to 17, inclusive, containing 450,000 cu. yds.; Sects. 30 to 34 (except 33), inclusive, 138,500 cu. yds.; banquette on Sects. part 43 to 50, inclusive, 126,400 cu. yds.; Sect. 80 and most of 81, 142,000 cu. yds; part of 16H, all of 17H, part of 18H, 98,900 cu. yds., new levee, part 18H and 19H; upper division (field work), 296,000 cu. yds.; middle division (woods), 195,000 cu. yds.; lower division (field), 298,000 cu. yds.; enlargement, part Sects. 21H and 22H, 51,000 cu. yds.

Jackson Barracks, Mo.—Bids will be received until Aug. 3 by Capt. B. T. Clayton, Q. M., New Orleans, for repairing wharf at Jackson Barracks.

**Dixville, N. H.*—The contract for building a earth dam with reinforced concrete core wall 500 ft. long and 70 ft. high across Mohawk River at Dixville for the Dixville Notch Corporation, has been let to Chas. E. Walbridge, of Plymouth, N. H., and work on it is in progress. It will carry a head of 65 ft. for about 200 ft. Engr., A. W. Dudley, of Manchester.

Portsmouth, N. H.—Bids will be received until Aug. 10 by R. C. Hollyday, Bureau of Yards & Docks, Navy Dept., Washington, D. C., for installing an electric elevator in the naval prison, Navy Yard, Portsmouth, as per specification No. 1553. Estimated cost, $3,250.

Bayonne, N. J.—The City Council is reported to have instructed F. W. Dalrymple, City Engr., to prepare plans and estimates for a recreation pier on Kill van Kull.

Mantua, N. J.—The following are reported to be the bids opened on June 21 by C. A. F. Flagler, Corps Engrs., U. S. A., at Wilmington, Del., for construction of jetty and cribs at the mouth of Mantua River, N. J.: Franklin W. Wills Co., $18,057; Tatnall-Brown Co., $19,691; Robt. B. Morrison, of New Castle, Del., $20,590; Armstrong & Latta Co., Philadelphia, Pa., $22,778; Latta & Ferry Constr. Co., Philadelphia, Pa., $19,198; Edw. F. Fonda Co., New York, N. Y., $22,875; Sanford & Brooks Co., Baltimore, Md., $25,137, and Richard Parrott, Newburgh, N. Y., $18,912.

Long Branch, N. J.—Bids will be received until Aug. 5 by the City Council for constructing a bulkhead on the ocean front near Atlantic Ave. Bryant B. Newcomb, City Clk.

Asbury Park, N. J.—W. T. Hunter, 38 Wall St., New York, N. Y., is Pres. and Ferd. R. Moeller, 837 Broad St., Newark, N. J., is Secy. and Treas., of a company which proposes constructing a pier bet. 1st and 2d Aves. in Asbury Park to cost bet. $300,000 and $350,000.

Somers Point, N. J.—Bids will be received by Jas. E. Scull, City Clk., until Aug. 5 for grading and graveling Harbor Lane and building a bulkhead or wharf on Harbor Lane, as advertised in The Engineering Record. E. D. Rightmire, City Engr., Bartlett Bldg., Atlantic City.

New York, N. Y.—The following are the bids opened on July 10 by Col. John G. D. Knight, Corps Engrs., U. S. A., for dredging (*a*) Coney Island Channel, (*b*) Flushing Bay (price given per cu. yd., scow meas.: N. J. Terminal Dock & Improvement Co., 62 Cedar St., *a* 31.5 cts.; R. G. Packard Co., 130 Pearl St., *a* 35 cts.; Maritime Dredging Co., 78 Broad St., *a* 31 cts., *b* 19⅔ cts.; Morris & Cumings Dredging Co., 17 State St., *a* 27.4 cts.; John & Jos. McSpirit, 118 Wayne St., Jersey City, N. J., *b* 39 cts.; J. M. Briggs, 154 Nassau St., *b* 29.7 cts.

Bids will be received July 26 (extension of date) by J. A. Bensel, Comr. of Docks, for contract 1054.—Furnishing material and for preparing for and building freight sheds on piers Nos. 54 and 56, North River, between foot of Little W. 12th and W. 14th Sts., on Chelsea section, with lateral extensions on adjacent bulkhead platforms. Security required $232.000.

St. George, S. I., N. Y.—Bids will be received by Geo. Cromwell, Boro. Pres., New Brighton, until July 30, for furnishing material and constructing reinforced concrete retaining walls on Jay St. and South St., and other work in connection with the St. George Ferry approach, as advertised in The Engineering Record. Engineer's estimate: 9,400 cu. yds. concrete in place, including forms; 1,100,000 lbs. steel in place; 23,000 cu. yds. excav.; 100 cu. yds. broken stone, for foundation; 2,500 lin. ft. granite coping on parapet wall; 70 lin. ft. special granite coping; 4,950 sq. ft. granite facing; 100 cu. yds. extra concrete for foundation, 1-3-6; 40,000 lin. ft. piles, furnished, driven and cut; 23 granite pedestals.

Oswego, N. Y.—Bids will be received by Col. H. M. Adams, Corps Engrs., U. S. A., Buffalo, until Aug. 17 for constructing stone-concrete superstructure on outer breakwater at Oswego, as advertised in The Engineering Record.

Albany, N. Y.—"Water."

Troy, N. Y.—Bids will be received until July 26 by Bd. Contract & Supply (Jas. M. Riley, Clk.) for furnishing material and repairing city docks at foot of 16th, 17th and 18th Sts. North End.

**Buffalo, N. Y.*—The Aldermanic Com. on Wharves and Harbors on June 24 voted to award contracts as follows: For deepening, widening and straightening Buffalo River and Cazenovia Creek (bids opened May 17): Sec. 2, Buffalo Dredging Co., $587,672; Sec. 3, same company, $213,460; and Sec. 4, Thos. Brown Contr. Co., $88,200. For detail bids received for this work see issue of The Engineering Record of June 8.

Cincinnati, O.—We are informed that no bids were received on June 20 by Lieut.-Col. Wm. Rossell, Corps Engrs. U. S. A., Cincinnati, for constructing concrete dam, etc., at head of Marietta Island, Ohio River.

Bids will be received until Aug. 12 by W. C. Culkins, City Aud., for $10,000 bonds, the proceeds to be used to construct a retaining wall and necessary drains on a portion of Gladstone Ave.; also, same date, for $80,000 bonds, the proceeds to be used to condemn land for extending Burnet Woods Park and for improving the same.

**Sandusky, O.*—Bids were opened on July 5 by Lieut. Col. C. McD. Townsend, Corps Engr., U. S. A., Cleveland, for work in Sandusky harbor as follows: (*a*) 16,000 cu. yds. drilling and blasting or otherwise breaking up bed rock; (*b*), 71,000 cu. yds. excav. and removing bed rock and overlying material. G. H. Breymann & Bros., Toledo, *a*, 4; *b*, $2; Great Lakes Dredge & Dock Co., Chicago, Ill. (successful bidder) *a*, $2.50; *b*, 65 cts.: Lake Erie Dredging Co., Buffalo, N. Y., *a*, $3.50; *b*, $1.95.

Carthage, O.—It is reported that bids will be received until July 29 for furnishing and placing fire escapes on the Central High School.

**Portland, Ore.*—The contract for furnishing about 1,200,000 tons stone (bids opened June 17 at the office of U. S. Engr.), has been awarded to Robt. Wakefield, of Portland, Ore., at $1.10 per ton for 200,000 tons, and $1.12 for 1,000,000 tons.

Panama.—Bids will be received until July 30 by D. W. Ross., Gen. Purchasing Agt., Isthmian Canal Comn., Washington, D. C., for furnishing per Canal Circular 376 the following: Electric fan motors, test pumps and gauges, iron pipe, steel pipe, rivets, etc.

Williamsport, Pa.—See "Paving and Roadmaking."

Erie, Pa.—We are informed that the State has appropriated $150,000 for the State St. dock extension in Erie. It will probably be built under supervision of a committee appointed by the Governor.

Philadelphia, Pa.—City Councils on July 1 substantially forwarded the plans for encircling the city with a chain of parks and connecting boulevards by passing bills for the condemnation of 550 acres of wood, valley and meadow land bordering Pennypacker and Cobb's Creeks.

Brownsville, Pa.—Bids will be received by Maj. H. C. Newcomer, Corps. Engrs., U. S. A., Pittsburg, until Aug. 12, for building a lock with 2 chambers, 2 guide walls and 2 guard walls at Brownsville, as advertised in The Engineering Record.

Providence, R. I.—Chas. R. Makepeace, Chmn. East Side Highway Com., estimates the cost of building a tunnel under Prospect Hill at $400,000, exclusive of cost of land or land damages.

Charleston, S. C.—The only bid received and opened on June 27 by Capt. G. P. Howell, Corps Engrs., U. S. A., for dredging canal bet. Sewee Bay and McClellanville, S. C., was submitted by P. Sanford Ross, Inc., Jersey City, N. J. He bid 42.2 cts. per cu. yd., place meas., at the monthly rate of 30,000 cu. yds., work to be begun within 60 days.

Nashville, Tenn.—The following are the bids opened on June 15 by Lieut. W. G. Caples, Corps. Engrs., U. S. A., for construction, delivery and erection of 2 steel lock gates, filling valves, etc., for each of locks 3 to 7, inclusive, in connection with Cumberland River improvement above Nashville: Baltimore Bridge Co., Baltimore, Md., $95,421; Penn Contr. Co., Pittsburgh, Pa., $91,318; and Penn Bridge Co., Beaver Falls, Pa., $85,100. The Atlanta Machine Wks., Atlanta, Ga., and Chattanooga Car & Fdry. Co., Chattanooga, Tenn., bid only for the valves, a total of $14,425 and $14,391, respectively.

Galveston, Tex.—Bids will be received until July 31 by Capt. John C. Oakes, Corps Engrs., U. S. A., Galveston, for dredging Inland Waterway between Aransas Pass and Pass Cavallo and to mouth of Guadalupe River through San Antonio and Mission Bays. Dredging, snagging and removal of rafts, etc., in Guadalupe River bet. its mouth and Victoria, Tex.

John M. Murch, Co. Aud., writes that Gen. H. M. Robert, late of Engrs. U. S. A., is now at Galveston, investigating and figuring for the county, cost, etc., of proposed causeway and bridge over Galveston Bay and Galveston Island.

Houston, Tex.—Geo. T. Horton, Co. Engr., writes that it is proposed to construct canal in Harris County to connect Brays Bayou with ship canal, at a cost of $15,000. John B. Ashe, Co. Aud.

Ft. Sam Houston, Tex.—Bids well be received by L. J. Fleming, Const. Q. M. U. S. A., until Aug. 5 for furnishing and installing metal frame wire screens in all openings in New Post Hospital, as advertised in The Engineering Record

Charlottesville, Va.—The Albemarle Telephone Co. has had plans and estimates completed for conduit and aerial cable, and would like bids from contractors for constructing same.

Wheeling, W. Va.—Bids will re received by Capt. F. C. Bogg, Corps Engrs., U. S. A., until Aug. 14 for furnishing and delivering iron and steel for bear-trap gates for Dam 18, Ohio River, as advertised in The Engineering Record.

**Ashland, Wis.*—Bids were opened on June 6 by Maj. Graham D. Fitch, Corps Engrs., U. S. A., Duluth, Mnn., for furnishing riprap at Ashland. The bids called for 60,000 tons of rock in place on top and sides of old breakwater, and Alex. Sang, of Duluth, Minn., secured the contract at 99 cts. per ton.; total cost, $59,400. The other bids received were: A. Donald & Co., Ashland, $1.07 per ton; Powell & Mitchell, Marquette, Mich., $1.25; and Northern Dredge Co., Duluth, Minn., 97 cts.

Racine, Wis.—Bids will be received by Maj. W. V. Judson, Corps Engrs. U. S. A., Milwaukee, until Aug. 2, for building crib breakwaters at Racine and Kenosha harbors, as advertised in The Engineering Record.

Superior, Wis.—Maj. Graham D. Fitch, Corps. Engrs., U. S. A., Duluth, Minn., writes that no bids were received on June 24 for building rubble mound breakwater at Superior Entry, Wis.

Casper, Wyo.—We are informed that no bids were received at the office of the U. S. Reclamation Service, Crawford, Neb., on June 5, for building the Pathfinder Dike, situated about 45 miles southwest of Casper, Wyo., and involving about 170,000 cu. yds. of earth excav. and about 16,000 cu. yds of riprap. Work will not be done during the present season. Further particulars may be obtained at the offices of the U. S. Reclamation Service, at Washington, D. C., Crawford, Neb., and Casper, Wyo.

Port Colborne, Ont.—Bids will be received until July 24 by Fred Gelinas, Secy. Dept. Pub. Wks., Ottawa, for furnishing and placing stone and concrete blocks along south face of western breakwater at Port Colborne.

Calgory, Alta.—Bids will be received until Aug. 2 by Fred. Gelinas, Secy. Dept. Pub. Wks., Ottawa, Ont., for an electric elevator at the Public Bldg., Calgary.

American Public Health Association. Secretary, Dr. C. O. Probst, Columbus, O.

THE PETROLITHIC ROLLING TAMPER.

A number of cities in South California have recently constructed a new type of pavement, known as the petrolithic pavement, which is in essence a particularly well-built form of oiled road. The leading feature of this pavement is the very complete compacting of the oiled material by means of a rolling tamper, shown in the accompanying illustration. It was designed to insure the tamping of the material from the lower portions upward to the surface, instead of downwards from the surface. The inventor received the idea from seeing a large flock of sheep walk over a newly plowed road. After the sheep had passed over it, the soil was found to be packed so hard that a pick indented it but a short distance. To obtain this effect with a roller, the circumference of the main roll is covered with tampers, which act like so many feet walking over the earth and packing it down. The specifications for a petrolithic pavement in Los Angeles include the following clause concerning the roller: "The tamping roller shall consist of a roller, the outer surface of which shall be studded with teeth not less than 7 in. long and having a surface area of not less than 4 sq. in. each. The roller itself to be of such a weight that the load upon each tooth shall be not less than 300 lb."

Before this roller is run over the roadway, the latter is plowed up to a depth of about 6 in. In important improvements in Los Angeles, before the plowing is done, the surface is carefully graded and all poor material removed, the depressions being filled up to the final surface. A roller is run over the surface so as to disclose all soft places before the final plowing. It is usual to insure the proper crowning with a road machine, and if there are any clods, a harrow is run over the ground until they are broken up thoroughly. The soil is then usually sprinkled with water and the lower part of the roadway for a thickness of about 2 in. is compacted with the tamping roller, but in some cases oil is sprinkled. An examination of the cut will show how the roller operates to accomplish the consolidation. Each of the teeth sinks to the hilt, so to speak, in the loose soil, leaving below it a compact area about equal to the area of the head of the tooth. The head is larger than the shank, so that when the tooth is pulled out of the hole some dirt falls back into the bottom of the latter. Then when the machine passes over the ground again, it packs the dirt a little nearer the surface, and repeated passages of this sort result in consolidating the earth until finally the tamper rides entirely upon the surface, if the rolling is continued to such a condition.

After the bottom 2 in. have been consolidated in the manner mentioned, oil tanks are driven over the roadway and the oil sprinkled evenly over the surface until one gallon per square yard of roadway has been applied. A cultivator is next run several times over the ground to mix the oil and the earth thoroughly, after which the rolling tamper begins its work again. The action of the tamper not only compresses and packs the soil but also

PETROLITHIC ROLLING TAMPER.

effects somewhat the mixing of the oil and the earth. This is due to the fact that as each tooth of the roller comes out of the hole it made, the head of the tooth acts like a rake upon the soil above the bottom of the hole. This process of oiling and tamping is repeated three times, until 3 gal. of oil per square yard have been thoroughly mixed with a layer of soil 4 in. thick and the oil begins to ooze on the surface of the roadway. Then the surface is ironed down with an ordinary roller and the pavement is thus completed.

This machine has been developed primarily for use with the oil obtained in California, which has an asphaltic base and has long been successfully used for oiling roads. There seems to be no reason, however, why the device should not compact ordinary dirt roads of certain classes in an economical manner. In fact where it is necessary for contracting purposes to haul a considerable amount of material over dirt roads of poor character, a trial of the petrolithic roller might very well be made. The teaming that has to be done on many contracts is an expensive feature of the work, and anything which will reduce this total expense by the payment of a relatively small sum deserves consideration. The roller is made by the Petrolithic Pavement Co., Pacific Electric Bldg., Los Angeles.

AN EXPERT OPINION ON CONVICT LABOR ON ROADS.

During recent years, particularly since the passage of laws in some States prohibiting employing convicts in work which brings their products into competition with those of regular industries, there has been a growing conviction that it would be advisable to use convict labor on road improvements. This proposal has met with opposition on two grounds. The first is that convicts working on a road would prevent its use by timid people and would thus be an unnecessary hardship on the public; this objection has been found quite strong near some cities where the plan was tried. The second ground of opposition to road improvements by convicts is that the latter are subject to conditions which increase the severity of their punishment beyond what the law contemplates. This may be true under some conditions, but it seems certain that there are sections of the Southern States where road work is liked by the convicts. They are well cared for under the supervision of proper authorities, and the regular hours, out-door life and minor privileges impracticable in a jail, are appreciated.

A rather amusing proof of this recently occurred in a State where convict labor on roads has been conducted for some years. For manifest reasons it would be unwise to give the locality, but the facts have been received from a responsible source. The Clerk of the State Convict Road Force applied to the jailer of Blank County for five men for highway work. Six men were sent to him, with this letter from the jailer:

"You will notice that where your order calls for five men, I send you six. No. 6 is Woodrow Harris. Woodrow Harris came to us after your requisition was in hand and after I had sent you my list. You'll have to take Woodrow Harris. He won't stay here. When the gang of five were leaving us to go to you, Woodrow kicked up such an infernal row about being left behind that we just had to let him go. He had been with you before, and he says you treat him O. K. He said if we didn't let him go to the convict camp he would kick holes in the jail. We don't want any holes kicked in this jail, so we have let Woodrow go, and be dog-goned to him."

Woodrow was evidently a man of some education, for he first made his plea for permission to go to the camp in the following verses:

Oh, take me back to the convict camp,
  Put me to work on the grade;
I like the scent of the canvas tent
  And the bunk the sergeant made.
Just take me out of this pesky jail
  To the camp and God's free air,
Away from this shack where the small greyback
  Skiddoos through my uncut hair.

Oh, take me back to the dining tent
  To feed with the bunch again,
Where every man gets a well-filled pan
  And eats till he gets a pain.
Give me a suit of Kentucky jeans,
  The same as you did before,
And I'll serve my time without a whine
  And chip in a few months more.

Take me back to the village of tents,
  I'm sick of the prison cell.
I'm an old hobo and I think I know
  When I strike a good hotel.
Please send me back to-day if you can;
  Just forget about your fee;
I have been there once and served six months
  And the road-man's job suits me.

BUSINESS NOTES.

The Pittsburg Automatic Vise & Tool Co., Pittsburg, has recently made a large shipment of vises to the Portsmouth (N. H.) Navy Yard. A large part of the shipment consisted of very large vises, weighing 695 lbs. each, especially adapted to the severe service in the Navy Yard.

The Blue Seal Portland Cement Co., Kansas City, Mo., is to erect immediately a mill with a capacity of 2,500 bbl. per day at Courtney, Jackson Co., Mo., 11 miles east of Kansas City, on the Sante Fe R. R. Oil or coal will be used for fuel. The contract for the building of the plant has been let to the Fuller Engineering Co., Allentown, Pa.

The Minneapolis Steel & Machinery Co., Minneapolis, Minn., has opened an office in Butte, Mont., in the Phœnix Building, which will handle the increasing trade of that State. Mr. J. E. Lanning will be manager of the new office.

The Raquette River Paper Co., Potsdam, N. Y., has contracted with the Ambursen Hydraulic Construction Co., Boston, for the building of a concrete-steel dam about 20 ft. high and 300 ft. long across the Raquette River at that point.

Robert W. Hunt & Co., Chicago, have been given the

inspection of the material for the Southern Pacific Co.'s rifled pipe line. This embraces 250 miles of 8-in. rifled pipe made by the Lorain plant of the National Tube Co., the pumping machinery and boilers.

A fireproof window sash has been designed by the Brown Hoisting Machinery Co., Cleveland, O., and is now being introduced rapidly. It is made of light structural shapes and in swinging or sliding types, as desired. The glass, which is embedded in putty between light angles, can be readily removed by unscrewing the angles on one side of the sash.

The United States Graphite Co., Saginaw, Mich., has developed a lubricating graphite in which the graphite is held in suspension in oil sufficiently long for it to perform its purposes when fed through oiling pipes. Amorphous graphite reduced to an impalpable powder is used, one teacupful of it being mixed with about a pint of oil.

Mr. John F. Carney, for many years connected with the selling department of The McCrum-Howell Co., but who has been for the past year manager of the heating department of the Barstow Stove Co., Providence, R. I., has accepted the position of manager of the Eastern branch of the National Regulator Co., manufacturers of heat regulating devices, with offices at 1135 Broadway, New York City.

The railroad, coal and machinery interests of New York have been showing their appreciation of the special advantages of the Coal & Iron National Banak as a depositary bank, and its combined capital, surplus and undivided profits have now reached $1,115,000. Mr. M. F. Burns, president of Burns Brothers, the largest retail coal dealers in the world, was elected a director of the bank last month.

The Freeborn Engineering & Construction Co. has moved its office in Kansas City to 605-615 Scarritt Building.

J. H. Wagenhorst & Co., Youngstown, O., manufacturers of electric blue printing machines, report the following partial list of sales: Cleveland Crane & Car Co., Wick Clinc, O.; Warren Steam Pump Co., Warren, Mass.; Vulcan Iron Works, Detroit, Mich.; A. O. Smith Co., Milwaukee, Wis.; Traylor Engineering Co., New York; John S. Cole Co., Charleston, W. Va.; Carnegie Steel Co., Youngstown, O.; District Pumping Station, Washington, D. C.; C. P. & E. R. R. Co., Willoughby, O.; Engene Dietzgen Co., Chicago, Ill.; Pardee Bros. & Co., Lattimer Mine, Pa.; Tennessee Coal, Iron & R. R. Co., Bessemer, Ala. Seven of these are repeat orders.

Mr. Embury McLean has acquired the interests of Mr. H. B. Haigh and Mr. John MacCormack in The Engineer Co., and has become president, Mr. Haigh and Mr. MacCormack having resigned as president and second vice-president, respectively. Mr. North McLean is the treasurer, and Mr. R. E. Fox, Jr., secretary. The company has relinquished its rights in Mr. MacCormack's patents on his stoker, and he will engage independently in its manufacture. This leaves the company free to push the installation of the "balanced draft" system in connection with any type of hand or mechanically stoked boiler furnace. At the present time the system is being used on boilers having a total capacity of about 500,000 h. p.

Mr. Otto Dieckmann, Jr., who has for some time been representing the Atlas Engine Works in St. Louis, has been appointed manager of the direct sales office of the same city.

The Westinghouse Electric Works at East Pittsburg have established another new record. During May the company shipped 750 carloads of electrical machinery, an average of 30 carloads a day, worth about $4,000,000. The high record heretofore was held by August, 1906, when 640 carloads were shipped. The shipments at the Westinghouse Machine Company's shops during May also reached the high-water mark, the company having sent out from the works 90 engines, aggregating 50,000 h.-p. These engines included gas engines from 10 to 1,000 h. p. and steam turbines from 1,000 to 10,000 h.-p.

The sales of the American Motor Roller, made by The Austin-Western Co., Ltd., and described in The Engineering Record of April 6, during its first month on the market, were as follows: City of St. Paul, Minn.; city of Two Harbors, Minn.; Duluth Township, St. Louis Co., Minn.; city of Hoquiam, Wash.; P. B. Moss, Billings, Mont.; Burke Bros., Ft. Smith, Ark.; village of Shelby, Mich.; Fayette Co., W. Va.; Harris Co., Tex.; Bradley Co., Tenn.; city of Charleston, W. Va.; Logan Co., O.; Erie Township, Ottawa Co., O.; Highland Township, Elk Co., Pa.; Cherrytree Township, Venango Co., Pa.; Russell Co., Va.

Mechanical draft for boilers is being installed by the B. F. Sturtevant Co., Boston, Mass., for Kitson Machine Shops, Inc., Lowell, Mass.; R. B. Whitacre & Co., St. Paul, Minn.; State Hospital, Morgantown, N. C.; Bemis & Call, Springfield, Mass.; General Chemical Co., Dundee, N. J.; General Chemical Co., Laurel Hill, L. I.; Lovegrove & Co., Inc., Philadelphia, Pa., and International Paper Co., Otis Mill, Chisholm, Me.

On July 2 the Keuffel & Esser Co. formally opened its two new buildings at Adams and Third Sts., Hoboken, which practically double its facilities. The two structures cover about 30,000 sq. ft. of ground, divided almost equally between the two, and were built of reinforced concrete by the Turner Construction Co. The office building is five stories high and slightly more elaborate in finish than the other. The shipping department occupies the whole of the ground floor, the general offices of the company are on the second floor, and the remaining floors are for stock rooms and storage. The new factory is six stories high. The lower four floors are used for wood-working, and lumber is stored in the rear of the lower two behind a fire wall. The fifth floor is used for paper mounting and the sixth for the manufacture of surveyors' tapes. The wood working machinery is driven by electric motors and an exhaust system is employed to remove the shavings and sawdust, which are fed to the boilers. There are two flights of stairs and two elevators in each building, enclosed by concrete partitions and kalameined doors held open with fusible links. The Keuffel & Esser Co. was established in 1867 by William Keuffel and Hermann Esser. The business was first carried on as an importing trade in a room on Nassau St., New York, the firm name being Keuffel & Esser. In 1868 the firm sought larger quarters on Nassau St., and after moving several times finally located at 127 Fulton St. in 1878, where they have remained for nearly thirty years. The business was incorporated in 1889. Although the business was established in 1867, it was not until 1870 that the firm began manufacturing. In 1871 the manufacturing branch was moved to Hoboken and since then has steadily grown until at the present time there is an extensive group of buildings. The personnel of the company is now: W. Keuffel, president; W. G. Keuffel, vice-president; C. M. Bernegau, treasurer; W. L. E. Keuffel, secretary.

PERSONAL NOTES.

Mr. Frederick Leach, formerly city engineer of Elmira, N. Y., has been appointed city engineer of Hornell, N. Y.

Mr. C. B. Scott, of Arritts, Va., has become resident engineer with the Virginia State Highway Commission, with headquarters at Lynchburg, Va.

Mr. E. D. Fletcher has resigned as chief engineer of the Tacoma Eastern R. R. to become city engineer of Hoquiam, Wash., succeeding Mr. G. D. Robertson, resigned.

Mr. Arnold W. Brunner, an architect of New York City, has been appointed a member of the Municipal Art Commission of New York, succeeding Mr. Walter Cook, resigned.

Mr. Alfred R. James, formerly assistant engineer with the United Railways & Electric Co., Baltimore, Md., has left for Panama, where he will join the engineering corps on the canal.

The United States Civil Service Commission will hold an examination Aug. 7 of candidates for the position of civil engineer and superintendent in the Quartermaster's Department.

Mr. L. N. Whitcraft has resigned as assistant engineer in the office of Mr. W. W. Crosby, State Highway Engineer of Maryland, to become road engineer of Somerset County, Md.

Mr. John F. Stevens, formerly chief engineer of the Isthmian Canal Commission, has been appointed a vice-president of the New York, New Haven & Hartford R. R., and will have charge of the operation of that line.

Mr. William O. Wood, formerly assistant superintendent of the Brooklyn Rapid Transit Co., Brooklyn, N. Y., has become the personal assistant of President Theodore Shonts, of the Interborough Rapid Transit Co., New York City.

Mr. Minard L. Holman, of the firm of Holman & Laird, consulting engineers, St. Louis, Mo., has been engaged by the City of Omaha, Neb., to prepare preliminary plans and estimates for the proposed new waterworks for that city.

Mr. William Graham, who recently resigned as assistant engineer of bridges and buildings of the Baltimore & Ohio R. R. Co., has accepted a similar position with the New York, New Haven & Hartford R. R., with headquarters in New Haven.

Mr. A. Jordahl, formerly with the Reinforced Cement Construction Co., of New York, has joined the engineering staff of W. S. Barstow & Co., of New York and Portland. He will have charge of the reinforced concrete work at the company's New York office.

Mr. E. C. Hawkins, who was recently succeded as chief engineer of the Oregon & Washington R. R. by Mr. H. F. Baldwin, formerly chief engineer of the Chicago & Alton Ry., has sailed for Katalla, Alaska, to take charge of work on the railroad now being built into the Copper River and Yukon region.

The McNichol contracts on which payments of large sums were withheld by the city of Philadelphia on the ground of fraud and collusion, have been approved by the arbitrator in the litigation between the city and the contractors, and the latter have been paid $2,049,330 by the city, in accordance with the decision. This is a large part of the sums retained by the city.

Mr. Mortimer G. Barnes, formerly a member of the engineering force of the Isthmian Canal Commission and at present connected with the engineering staff of the Board of Water Supply of New York, has been appointed a member of the Board of Advisory Engineers of the New York State Barge Canal, succeeding Dr. E. L. Corthell, who resigned a number of years ago.

Mr. L. W. Jones has resigned his position as president of the Pittsburg Filter Mfg. Co., and has also severed his connection with its board of directors. He has been connected with the company since 1903. He proposes to open an office shortly in Pittsburg as consulting engineer, taking up municipal and industrial fitration plants, water softening and sewage disposal plants.

Mr. C. E. Grunsky has opened an office as consulting engineer at 2033 Florida Ave., Washington. For twelve years Mr. Grunsky was engaged in private practice in California, and in addition to this work he has served as the assistant State engineer of California, as a member of the California Rivers and Harbors Commission, as a member of the San Francisco Sewerage Commission, as city engineer of San Francisco for four years, as a member of the Isthmian Canal Commission, and as a consulting engineer in the United States Reclamation Service.

Prof. W. F. M. Goss, who has severed his connection with Purdue University to become dean of the College of Engineering of the University of Illinois, has long been closely identified with the development of motive power on railways and it is understood that his new duties will in no way conflict with the continuation of his investigations along that line. This is gratifying to those who know the strength of his influence in bringing about the scientific testing of locomotives, of which the admirable station of the Pennsylvania R. R. at Altoona is the latest instance, as well as the importance of his work for the Master Car Builders' Association.

The following transfers in the Corps of Engineers, U. S. A., recently have been ordered: Maj. W. W. Harts, from Chattanooga to Nashville, Tenn., in connection with his duties as engineer in charge of the Chatanooga and Nashville engineer districts; Capt. Edward M. Markham, from 2d Battalion of Engineers, Washington Barracks, to the office of the engineer commission of the District of Columbia, as assistant; Capt. Hubert L. Wigmore, to the 2d Battalion of Engineers; Capt. Michael J. McDonough from duty as assistant intructor at the Military Academy to the 3d Battalion of Engineers, Fort Leavenworth, Kan.; First Lieutenants De Witt C. Jones, Francis B. Wilby and Clarence S. Ridley, from 3d Battalion of Engineers to the Engineer School, Washington Barracks; First Lieutenants Douglas MacArthur and Ulysses V. Grant, 3d, from the Engineer School to Milwaukee, Wis., and Boston, Mass., respectively; First Lieutenants William H. Rose, Robert P. Howell, Jr., and Joseph H. Earle, from the Engineer School to the 3d Battalion of Engineers.

Mr. Andrew Rosewater has been declared city engineer of Omaha, Neb., by the Supreme Court of the State in a decision which upholds in every detail the decision rendered by the District Court of Douglas County. In 1903 Mr. Rosewater was appointed for a three-year term. At the end of that period the Mayor of Omaha appointed as Mr. Rosewater's successor, Mr. Jesse Lowe, who was confirmed by the Council, but who refused to qualify for the office. Thirty days after the refusal Mr. Rosewater qualified and continued to discharge the duties of the office. Afterward Mr. Thomas Shaw was elected by the Council and started suit to get possession of the office. It was this suit which has just been decided. The court said: "A city engineer of a city of the metropolitan class holds the office until his successor is duly elected and qualified. The failure to qualify by one who has been appointed as his successor by the Mayor and confirmed by the Council, but who has not taken possession of the office or entered on the discharge of his duties, does not render the office vacant. Upon such a failure to qualify the incumbent may qualify anew under section 15, chapter 10, compiled statutes 1905.. When it is the duty of the Mayor to appoint an officer and he fails to do so the Council may elect, but this power of the Council does not exist when one who has been appointed by the Mayor and confirmed by the Council fails to qualify, leaving an incumbent to hold over until his successor is elected and qualified, in such a case the incumbent may qualify and take the office for the succeeding term."

THE MEXICO CONVENTION OF THE AMERICAN SOCIETY OF CIVIL ENGINEERS.

The 39th annual convention of the Society convened in the City of Mexico on the evening of June 8, in the Minera, this ancient, interesting and appropriate building being placed at the service of the Society by the Federal government, with characteristic and generous hospitality. For the especial pleasure of this annual meeting and the enjoyment of its many and varied entertainments, lavishly provided and artistically presented by the various departments of the Federal government, the Mexico Electric Tramways, Ltd., the Mexican Light & Power Co., the Mexican Ry., the Mexican Central Ry., the Mexican Association of Engineers and Architects, and the Mexican members of the American Society of Civil Engineers and the local committee on entertainment, et al., the visiting members of the Society and guests are indebted primarily to the invitation of President Diaz to hold this convention in the city. By hearty and appropriate resolutions and speeches the recipients of these attentions expressed their lively appreciation of the courtesies extended and the pleasures afforded, and the convention passes to record as one of the most enjoyable in the history of the Society, particularly as one of those happy ooccasions tending to establish cordial relations between the United States and Mexico.

A brief account of the several meetings, touching only the more important or interesting features or business, will first be given, leaving the details to appear in the Society's "Proceedings":

July 8.—At 9 p. m. the convention was called to order in the great audience room of the Minera by Sr. Leandro Fernandez, president of the Mexican Association of Engineers and Architects and Minister of the Department of Communications and Public Works of Mexico, as honorary presiding officer of the meeting. T address of welcome was delivered by Sr. Ramon rola, of the Mexican Society, and was responded by Mr. Onward Bates, vice-president of the American Society, who, in the unavoidable absence of Presi-
The matter was referred to the Board of Directors to
dent Benzenberg, presided over all subsequent meetings. The session was short and the evening was devoted to music and sociability.

July 9.—At 9 p. m. the second session was called to order, and the president's annual address was read. Selection from it were printed in The Engineering Record of July 13. The first business considered was the time and place for the next annual meeting. Out of over 500 expressions from the membership previously received in answer to the usual circular inquiry, over 300 designated Denver as the desired place, the remainder being divided between a dozen or more cities. The matter was referred to the Board of Direction to fix the time and place.

The report of the Special Committee on Rail Sections was then presented. This report had been received by the secretary after his arrival in Mexico, and its consideration was objected to because it had not been received in time to permit its publication and discussion as required by a resolution adopted by the Society in 1894. It was finally received and read and made an order of business for the next annual meeting and in the meantime will be published in the "Proceedings" and discussed by the membership.

July 10.—Morning.—The third session was called to order at 10 a. m., and the professional topics of discussion were at once taken up.

Topic 1—Water Supplies.—The question for discussion was the advisability of controlling watersheds sufficiently to prevent the pollution of impounded supplies, or of allowing a certain amount of contamination and relying on filtration to correct its effects. The subject was opened by a written communication from Mr. George W. Fuller, who pointed out the important influence of local conditions, particularly as to the quality of water which it is desired to obtain, which quality must or ought to meet certain rational requirements of local or state health authorities. Water supplies believed to be good ten years ago, are not in all cases now regarded as satisfactory in quality, and of those now regarded as good, some of them may not be so regarded a few years hence.

The basic thoughts or premises for the discussion are as follows: 1. Water from impounding reservoirs, or any other source, must be substantially free from disease-producing germs. 2. A satisfactory public water supply should be of good appearance, and free from objectionable quantities of mud, turbidity and vegetable stain. 3. A satisfactory supply should be free from objectionable tastes and odors. 4. Impounding reservoirs are of much assistance in the purification of water through natural agencies as regards the removal of bacteria, turbidity and peaty color, but their efficiency varies much with conditions. 5. The elimination of pollution through purchase of land is highly desirable, but in many places is prohibited by its cost. Sanitary control through inspection is helpful, but difficult under existing laws and customs. 6. A well designed and well operated filter plant with its various appurtenances, such as efficient aeration, sedimentation and coagulation, will allow a satisfactory water to be obtained from practically any impounded water supply.

A large proportion of the disease germs disappear from water impounded in a reservoir having a capacity equal to the volume of water removed from it during a period of many weeks or months, but the fact that with present laboratory methods it is very difficult to detect germs in water that has stood some weeks, does not prove that all the germs have died. Our knowledge is limited regarding the passage of disease germs through reservoirs, and the currents and stratification in the latter, but it should be remembered that the disease germs passing through the outlet are not always as low as would result from the stay of these germs in water for the same number of days as the capacity in days of the reservoir. Heavy rains may increase the pollution by washing the filth of months into the reservoir. Notwithstanding its shortcomings the impounding reservoir is a valuable adjunct in many places. One of its weaknesses is that its inefficiency cannot always be detected or corrected in time to avert danger, and this draws attention to the prevention of pollution on the watershed or its correction by filtration.

Sedimentation usually produces sufficient clarification, and the remaining turbidity, if any, is usually due to very fine particles. Tastes and odors, sometimes due to decomposition of organic matter or a vegetable growth in the reservoir, are the most disagreeable physical conditions. Stripping does much in the early life of a reservoir to reduce these tastes and odors, but its effect is not permanent. In order to obtain a thoroughly "clean" supply, filtration or aeration, or both, must be used in connection with an impounding basin. There are, of course, exceptions to this rule.

Both mechanical and slow sand filters have been successfully used for impounded supplies. The cost of plants ranges from $15,000 to $30,000 per million gallons daily capacity, and the cost of operation and capital charges at 5 per cent. for reservoir waters for a plant of moderate size are about $7 per million gallons. Filters remove from 97 to 99.5 per cent. of the bacteria in the applied water.

In deciding whether to obtain control of the watershed or build a filter plant it must be remembered that a pure water is better than a purified one and that any grade of filtered water can be secured by proper methods. For large watersheds it is hardly feasible to purchase the entire area for anything like as small a sum as would permit efficient filtration for all time. If the costs were equal, Mr. Fuller would prefer filtration as giving a suitable supply at all times. A campaign of education is required before the control of watersheds will produce satisfactory results, and the results will be largely in proportion to the vigor with which sanitary laws are enforced. The history of sanitary control of watersheds shows that it does not offer, in Mr. Fuller's opinion, as good protection to the water consumer as does modern filtration. More stringent sanitary laws, better inspection and better understanding of the residents on the watershed will help improve the results. A marked improvement has been made in the last ten years in filtration, and the results to-day are good. A single plant is easier to manage than a population on a large watershed. In England the majority of engineers have provided both for filtration and for the purchase of the watershed.

Mr. Fuller's conclusions are: The purchase and control of the watershed is less efficient and, for projects of much magnitude, more expensive than filtration; sanitary control of a watershed is of much assistance but is difficult under present conditions; the impounding of water makes filtration easier, cheaper, and more effective; there is a growing tendency to provide good sanitary conditions on the watershed, notwithstanding the efficiency of filtration at reasonable cost; it is not advisable to purchase the entire watershed, as the money can be better spent in other ways.

Mr. Herbert Snow, chief engineer of the Pennsylvania Department of Health, sent a written discussion of this topic in which he gave a statement of the series of epidemics of typhoid and enteric diseases that led to the enactment of the present stringent laws regarding water and sewerage works in that State. These epidemics have convinced him that no unfiltered surface water in any way likely to be polluted by sewage is absolutely safe for drinking purposes. Moreover, he does not believe filtration is an absolute safeguard, particularly when the source of supply is subject to sewage pollution. He contended that the interests of public health demand that sewage pollution of public water supplies should cease. Standards of excellence in the design, construction and operation of water filter plants are first essentials to guard the public health, but this safeguard should not be a premium on the use of a water course as a sewer by some upstream municipality. A certain quantity of sewage is bound to find its way into the waters of most inhabitated areas, but the legalizing of a certain amount of pollution of such waters, relying upon filtration to correct its effects, he regarded as a dangerous expedient to practice generally.

Mr. D. D. Clarke sent a written discussion of the topic, in which he held that it is better to secure a supply of unquestioned purity rather than attempt the purification of waters known to be contaminated in the least degree, when financial conditions permit this. He instanced the water works of Portland as an instance of this. The supply comes from a watershed on the western slope of the Cascade Mountains. This was mostly government land at the time of the construction of the works, and the city authorities succeeded in having the tract of 222 square miles withdrawn from settlement as a national reservation. All improved claims within the tract were purchased and other private titles are being extinguished as fast as practicable. The watershed is absolutely uninhabited, and is patroled by government rangers and employes of the city .

A written discussion by Mr. George A. Soper and oral discussions by Messrs. J. Waldo Smith, G. S. Williams, S. Bent Russell, Marroquin y Revira, Chas. B. Ball and J. T. N. Anderson agreed quite generally with the conclusions of Mr. Fuller on the principle involved.

Topic 2, Foundations.—The second topic for discussion was a triple one: (*a*) What is the best system of foundations for heavy structures on ground like that of the City of Mexico, which is an alluvial deposit about 300 ft. deepe (*b*) When used in foundations, will steel, independently or in combination with other materials, last indefinitely when in contact with water? (*c*) Will the strength and durability of concrete in foundations be affected if, before setting, there is an excess of water, a lack of compression, or too rapid drying.

The discussion was opened by a written communication from Mr. John F. O'Rourke, in which he pointed out that the resistance of soft ground to pressure depends largely on the degree to which it is confined. Foundations in such material may be constructed by giving the bearing surface such an area that the load is reduced to one that the material will sustain safely, or by carrying the footings to such a depth that the weight of the adjoining material prevents displacement of the material under the footings. He stated that ground over a considerable surface and an initial settlement was permissible. He had built heavy bridge piers on material into which a man would sink somewhat while standing on it, by distributing the weight over a considerable area in such a way that it had to act as a unit. The same thing is true of piling. A pile that may hardly sustain its own weight after being driven in a marsh will often become so set after staying unloaded for a few days that several heavy blows of a pile-driver may be necessary to start it again. The piles for the false work employed in erecting the first span of the Poughkeepsie bridge, for example, were driven 100 feet below the water level into about 60 feet of silt. They carried from 10 to 20 tons each and when it was necessary to pull them up for use at the second span, it was necessary to strike them a dozen heavy blows with a 6,000-lb. hammer. This started them so that they could be readily driven enough to enable them to be pulled.

Either of these methods might be used in Mexico, provided the ground contained nothing likely to cause the decay of the material used in it. If the ground is clay, it will probably preserve wood as well as water; Mr. O'Rourke stated that he had seen wood which had been perfectly preserved by clay for more than a century. He believed that water would not seriously corrode steel provided the water remained unchanged, and he mentioned a number of examples of steel remaining unaffected by water for many years. He had seen the same thing shown by nails and rods in wooden foundations where they were surrounded by material impervious to air. Casing the steel in concrete he considered an absolute preventative of rusting.

Too rapid drying of the concrete, preventing the setting of the cement, will make the material practically worthless. This is sometimes seen in connection with pneumatic caisson work, where the air that escapes through the concrete in passing out of the air chamber of a caisson is most likely to cause veins through the concrete from which the water evaporates before the concrete has had a chance to set.

The discussion was participated in by Sr. Marroquin y Revira, Maj. L. H. Beach, Messrs. F. G. Jonah, S. Bent Russell, E. M. T. Ryder, Miguel Roboliedo and others. The subject naturally called forth many interesting facts and theories which will appear in the "Proceedings" in due titme.

July 10.—*Afternoon.*—In the afternoon meeting the professional discussions were at once resumed, beginning with topic third.

July 10.—Afternoon.—In the afternoon meeting the was: Will the paving materials of the present be used in the construction of the pavements of the future? A written communication from Mr. George W. Tillson was presented in opening this discussion. It was his opinion that engineers had not made the most of the paving materials at their command and had not studied sufficiently the requirements of each individual street. Although it is acknowledged that the foundations of pavements are very important, they are constantly neglected, and the effect of this neglect is particularly noticeable in the case of block pavements.

Stone block pavements are capable of great improvement by using smaller blocks with their surfaces dressed more closely than is now the practice in this country. If the blocks are smaller and better dressed, the joints can be filled with a bituminous paving composition alone,

without gravel, which will reduce the noise. Mr. Tillson believes that well-dressed granite blocks 3 to 3½-in. thick, laid close together with a bituminous joint, will be very satisfactory on many streets. The noise from brick pavements is an objection to their use which might be materially reduced by using a yielding substance in the joints and bedding the bricks in it as well.

Asphalt pavements are capable of improvement, in his opinion, and he commended the suggestions made for this purpose in Mr. Clifford Richardson's paper, recently printed in this journal. Those suggestions will give, he believes, a pavement that will be successful on many streets where the traffic is now generally considered too heavy for sheet asphalt. Failures with pavements of this material have generally been due to improper designs, and improvements are to be expected by avoiding the defects. Mr. Tillson considers that good asphalt blocks will make satisfactory pavements on steep grades, and referred to elaborate experiments now being made to ascertain a proper method of testing the blocks.

The modern wood pavement, when dry and first laid, is practically ideal, according to Mr. Tillson, and, when its slipperiness in wet weather is overcome, he thinks it is bound to have an important future, particularly if the preservative processes are as satisfactory as those employing them claim. Its cost is likely to increase, however, owing to the constant rise in the price of suitable lumber, and the problem of discovering how many species of wood may be used satisfactorily is now receiving much attention.

In summing up, Mr. Tillson stated that the improvements in pavements in the future are to be brought about by a different use of the materials now in vogue, rather than by the adoption of entirely new materials. By studying the needs of the different streets to be paved, by using the materials now available intelligently, both as to manner and combination, the municipal engineer can bring about results greatly in advance of present practice.

Mr. J. H. Haylow submitted a written communication calling attention to the importance of the part of the pavement adjoining street rails, which always fails first. This is sometimes caused by the faulty construction of the railway roadbed or by the lack of rigidity of the track or by an unsuitable rail section. In his opinion a T-rail should never be used in a street paved with brick, granite or asphalt. With such a rail, he said, the pavement has no protection whatever from the grind of the wheel flanges and steel tires, the groove in the rail rarely being wide enough to be entirely free with the wider flanges and inequalities in the gauge of car tracks, and the pavement is subject to the constant wear of steel tires. Asphalt should never be laid next to the rail, he stated.

Mr Clifford Richardson submitted a written discussion in which he agreed with Mr. Tillson that the failure of most pavements is as much due to lack of foundation as to any other defect, anad this has been particularly the case in Manhattan. Granite block pavements are capable of great improvement, he stated, and he suggested that the form of construction practiced in Liverpool might very well be imitated here. American blocks are not well dressed and are too large to bed properly. He considered that a granite block when well dressed should not be more than 3 in. square. Brick pavements are suitable for streets of moderate traffic, when well made; the careless way in which the bricks are embedded in the sand cushion is often the cause of their defects.

Mr Richardson did not agree, however, with Mr. Tillson's views of wood pavements. He believes that it is almost impossible to replace an opening in such a pavement so that it will remain even under traffic. The Municipal Council of Paris is so dissatisfied with such pavements that it is endeavoring in every way to limit the amount of wood paving that is done. London streets which are to carry heavy traffic must be replaced every seven or eight years, even where a 6-in. block is used. The British and French engineers do not use so much impregnating material as is employed here with the wood blocks, and consider that only enough to prevent rotting is necessary.

Asphalt blocks have proved extremely satisfactory on residence streets for many years, there being one street in Washington so paved in 1883 that is still in very satisfactory condition. These blocks do not seem to resist heavy traffic well, however, as is shown by the pavement on Fourth Avenue, Manhattan, between 32d and 34th Sts., where the blocks began to go to pieces within eighteen months. Mr Richardson believes that a considerable improvement can be made in the quality of the blocks, which will render them less susceptible to temperature changes.

Bituminous concrete pavements are well suited to streets of light traffic, according to Mr Richardson, who referred to such a pavement put down in Muskegon in 1902 and still in good condition after five years of use. In order for them to be successful he believed that they should contain no stone larger than 1 in., and the amount of fine material should be larger than was thought desirable formerly. He does not believe that such pavements are suitable for streets of heavy traffic because the horses' hoofs tear out the coarse stones.

In considering street pavements it is necessary to pay attention to the effect of the many openings made in them for one reason or another. The repairs which are necessary owing to these openings must be considered in determining the total cost of any pavement, for if they are difficult to make properly the low first cost of a pavement which is often torn open does not amount to much.

What is needed in the United States, according to Mr. Richardson, is not new material for the construction of street surfaces, but an improved form of construction of those whoch have been in use for the last twenty years, together with a study of the actual cost per annum per ton of traffic carried per lineal foot of the street. That there is a large field for improvement in the character of our pavements is quite evident, and this improvement must lie with the municipal engineer. The best contractors are always in favor of doing the best work compatible with the price they get.

Messrs. Lawton, P. W. Henry, Horace Andrews, E. M. T. Ryder and G. S. Williams, and Major L. H. Beach also took part in the discussion. It was quite generally agreed that the future improvement in pavements would come through a more scientific use of present materials and perfection of construction rather than in a possible discovery of new and, at present, unknown materials.

Topic 4; Electric Railways.—Two questions were proposed for discussion: (*a*) What are the factors that determine the maximum economical grade for electric railways? (*b*) In establishing direct lines with heavy grades, under what conditions will it be found practicable to use electric locomotives and gas-engine generating stations, rather than traction by steam locomotives? The discussion was opened by a written communication from Mr. George Gibbs, who stated that the first question could only be considered in generalities, either obvious or of little use in a special case. A line is conceivable having grades so located that, with a given train interval, all trains may be ascending simultaneously, so that the power plant and transmission lines must be designed to supply all trains with power at the same time, even if this maximum requirement lasts but a short time. A line with the same maximum grades, but with the grades differently located, might readily have a much lower maximum demand on the power station. Again, the length of a grade is of special significance in electric traction, or short maximum grades, the limit of motor capacity is in the commutation of the current; with long grades, the limit is in the heating of the motors. The grades are generally a factor of less importance in electric traction than in steam, particularly when the trains consist of several motor cars. The facility with which electric trains surmount short heavy grades is particularly important in separating steam and electric lines at crossings. The important points to be considered in laying out an electric line as compared with a steam line are summed up by Mr. Gibbs as follows: 1. The effect of density of traffic in averaging the load requirements at the power house; 2, the effect of location of grades, especially with infrequent service, in averaging load requirements at the power house; 3, the wider latitude in fixing the maximum grades because of the greater adhesion ratio; 4, limiting commutating effects on short grades; 5, the motor-heating effects on long grades; 6, the less effect of grades on speeds because of the greater accelerating ratio.

Even if electric traction should prove desirable, it by no means follows that power may be best furnished from a plant driven by gas engines. From the point of view of economy of power, the gas-engine plant promises well, but from the point of view of availability Mr. Gibbs sees in it two limitations. The first is the small overload capacity of the gas engine, which is disadvantageous for fluctuating railway loads, and the second is the relative small size of producer plant units that have been built up to the present time.

The paper was discussed by Messrs. Onward Bates, R. F. Hayward, W. W. Follett, J. T. N. Anderson and T. A. Corry.

July 10.—Evening. In the evening the last meeting of the convention was held and the remaining professional subject for consideration was taken up.

Topic 5, Gas Engines.—Two questions were presented for discussion: (*a*) What is the best apparatus and most economical system for cleaning producer or furnace gas to be used in gas engines? (*b*) To what extent is ordinary producer gas made from bituminous coal used in gas engines, and what practical results have been obtained by any methods for removing tar and soot? The discussion was opened with a written communication from Mr. James Christie who pointed out that it was necessary to cool as well as clean the gas, but when these ends are attained by a washing apparatus it also becomes desirable to remove the moisture as much as possible. Centrifugal apparatus of large capacity has proved highly efficient and economical of space and water. An American plant is reported to have removed 97 per cent. of the solid impurities in the gas. As a general thing, with large plants, Mr. Christie believed that the water consumption will vary from 10 to 25 gal. per 100 cu. ft. of gas washed and the power required will be from 0.1 to 0.2 h.-p.

When bituminous coal is gasified in a producer at a rate below 10 lb. per square foot of fire bed, the quantity of tar suspended in the gas is comparatively large, the quantity of soot is small, and the temperature of the issuing gas is low. With a rate of 20 to 30 lb., as in some mechanically operated producers, the quantity of tar is small, the discharge of soot is greater and the temperature of the gas much higher. The quality of the gas appears to be about the same in each case. It is necessary to cool this gas, remove the tar and soot, and dry the gas. The utilization of the sensible heat of the gas has been accomplished successfully by applying the heat to generate steam for the producer, or for preheating the air supply, or for both. The tar problem has been handled by separating it by centrifugal action, as is done in St. Louis, and by decomposition by passing the gas through a supplementary bed of incandescent coke or anthracite. Altogether, Mr. Christie did not care to assert that the generation of producer gas from bituminous coal is in a satisfactory state of development as yet.

A written discussion of the two questions was also received from Prof. R. H. Fernald, giving results of some of the tests made by the United States Geological Survey with producer plants. Although many of the coals tested had been high in sulphur, and no attempt was made to remove it, the engine receiving this gas showed absolutely no signs of injury. Curves were given showing a remarkably better utilization of the heat in about eighty soft coals and lignites in the producer and gas engine plant than in the steam plant. Several low-grade coals and lignites were used successfully in the producer which were practically worthless under a boiler. These results gain importance from the fact that the producer used in the tests was made for anthracite coal.

The topic was discussed by Mr. Buchanan, and two written discussions were read by title.

A motion was carried authorizing the appointment of a committee of three to draft and have published in the local press appropriate resolutions conveying the thanks of the Society to the Federal Government and its officials, to the local engineering societies, to the municipal authorities, to the Mexican Electric Tramways, Ltd., to the Light & Power Company, the railways and others for the many courtesies extended. Vice-President Onward Bates then declared the convention adjourned.

Entertainments.—On July 4 most of the members in attendance with the ladies who accompanied them gathered at St. Louis, whence they journeyed in a well equipped special train over the Iron Mountain, Texas & Pacific, International & Great Northern and the National of Mexico lines to Mexico City, arriving at the latter place about 75 strong on July 7, after a delightful trip. Other members arriving by different routes swelled the total number in attendance to about 175.

July 8 was devoted to excursions about the city in seven "specials," as the guests of the street railway company, accompanied by members of the Mexican engineering societies, national engineering school and others, making a party of 300. Zocalo, Guadalupe, Talapain, the Country Club, where a delightful lunch was served; Churuhusco, San Angel, Chapultepec and the power house of the street railway company were visited, and filled the day with continued and a succession of varied and enjoyable experiences.

July 9 was devoted to an interesting inspection of the water works now under construction for the city, and elsewhere described, the members being the guests of the Water Works Commission. The reservoir, the conduit and the various unusual springs, whence come the water, were all seen. The trip occupied the entire day and was made in special trains over the street railway lines and the railway line along the conduit built to facilitate the construction of the latter. On the way out it was announced that at Nativitas one group of the springs at the end of the railway on the south shore of Lake Xochimilco, refreshments would be served. In that out-of-the-way place hand sandwiches were expected as a matter of course, so it is easy to imagine the surprise of the excursionists to find a rustic pavilion artistically decorated and festooned in natural flowers, with the American flag and the emblem of the American Society worked in flowers, hanging long rows of tables with an excellent service. The luncheon that was served took about two hours and was much enjoyed. It was followed by speeches and toasts. Presidents Diaz and Roosevelt, the Water Works Commission, its chief engineer, Sr. Manuel Marroquin y Rivera, the American Society of Engineers, the entertainment committee and others were all toasted and the first lady of the land, Mrs. Diaz, and the ladies present were not forgotten. This delightful occasion was enlivened by excellent music by the military band from the 10th regiment of the Mexican army. The return trip was then made.

July 11 and 12 were occupied by an excursion to

Necaxa, 175 miles northeast of Mexico City, as the guests of the Mexican Light & Power Co., to view the latter's great water power plant, generating and transmitting electrical power to Mexico City and vicinity over distances varying from 170 to 200 miles, whereby the city is lighted; its entire street car service moved, and many industrial plants run. Part of these works were illustrated in The Engineering Record of June 9, 1906. What the visitors saw were Necaxa, once a small and ancient Mexican village, converted into a bustling model construction camp, beautifully situated on a head land, from which, in two magnificent leaps, one from a height of 460 ft. and the other from a dizzy eminence of 740 ft., the waters of Necaxa River plunge in sheer drops to the depths below; the great power house, turbines and generators below, and the storage reservoir, in course of construction, above the falls, and the towers of the transmission lines scaling the heights toward Mexico. All these things are set in tropical mountain scenery of amazing grandeur, the indescribable beauties of which now reveal and then hide themselves as one drops down from the top of the mountains to Necaxa by means of the remarkable railway built for construction purposes, which winds and loops and drops on 8 per cent. grades and curves as sharp as a turn around a street corner. This is a narrow gage road and possible of operation by geared and articulated engines of the Shay type only. It is 20 miles long.

During the inspection of the falls and works, the visitors were lowered and raised over the falls in aerial cages, the first having a drop of 460 and the second 760 ft. This was a novel and interesting experience. These cages accommodate 30 people per trip. They are operated by cable hoists and are guided by and run on steel cables supported by a head frame at the top and by an anchorage at the bottom of the fall, and have an inclination of about 30 degrees from the vertical.

The party stopped over night at Necaxa and, after a sumptuous dinner, spent an enjoyable evening in songs and dancing. Mr. R. F. Hayward, general manager of the company, and his assistants had made every preparation, and the entire excursion was one of comfort and unalloyed pleasure and profit.

On July 13, the Society was received at 10 a. m. at the National Palace by President Diaz; in the afternoon from 1 to 5 o'clock it was entertained at an elaborate banquet at the National Military College at Chapultepec by the Association of Engineers and Architects of Mexico; and, in the evening by the Military College at a reception held in the Minera. All of these functions were thoroughly enjoyable and were marked by appropriate and happy interchanges. The palace and grounds of Chapultepec were open to the visitors, and this beautiful and historic shrine of the Aztecs, now the home of the President, was found to be full of interest. It might be stated here that during the entire stay of the Society in Mexico, the hospitality and attention lavished on its members were most cordial and unbounded.

On July 14 the visitors attended the French celebration of the fall of the Bastile, which was witnessed by a large crowd in Luna Park (the Coney Island of Mexico); and in the afternoon, the national ball game of Mexico, Belota, was an interesting entertainment.

On July 15 the Society were the guests of the Mexican Government in a visit to and inspection of the notable drainage works of the City of Mexico. A special train was run to the head of the Grand Canal on the northern shore of Lake Texcoco, lying east of the city and thence along the canal northward to the entrance to the tunnel which pierces the rims of the drainage basin on the north and gives an outlet to the waters of the valley of Mexico.

The total length of the Grand Canal is 16.8 miles from Lake Texcoco to the point where it enters the tunnel. The tunnel is 6.8 miles long and has a capacity of 618 cu. ft. of water discharged per second. The canal has an equal capacity and varies in depth from 15 to 50 ft., the depth increasing uniformly from Lake Texcoco to the tunnel. At the head of the canal at the lake, the water is controlled by head gates to regulate the level of the water in the lake, and, at the entrance to the tunnel, the flow in the canal is controlled by massive, monumental masonry and gates suitably inscribed. The tunnel is lined with masonry throughout.

The various other historical lakes in the valley drain into Lake Texcoco and all of the sewage and drainage of the city flows into the secondary canals which flow either into Texcoco or the Grand canal, so that the drainage of the valley and the city is now complete, the water having been turned through the Grand canal and tunnel in March, 1906. The drainage of the city was a problem that confronted the Aztecs when the city was founded, and, from that remote time until the completion of the now admirable work, the Spaniards and the Mexicans struggled with it.

As usual during its stay, the Society was entertained with an elaborate banquet enlivened by music from a military band on arrival at the end of the drainage works.

July 16 and 17 were the closing days of the entertainments and were occupied by a trip on July 16 over the Mexican Ry to Orizaba, and on Wednesday to Cuernevaca over the Mexican Central Ry. as the guests of these roads and the Mexican members of the Society.

On the trip to Orizaba, the railway drops from the table land 3,000 ft. in 16 miles to the valley of the Rio Blanco, affording grand views of tropical mountains and vales; the view from the heights above Maltrata down on that beautiful village and its surrounding fields lying only a mile away horizontally but 2,500 ft. below, with the tops of the enclosing mountains piercing the clouds, being especially grand, and exquisitely beautiful in detail. It is idle to attempt a worthy word picture of this view.

The trip the following day to Cuernevaca, the ancient home and capital of Cortez, with its palace, cathedral, and gardens, and also the transitory home of Maximilian, was not less interesting and beautiful in natural scenery. From Mexico City, the railway climbs to an altitude of 10,000 ft. and then drops 5,000 ft. to Cuernavaca. On the return, the train was stopped on top of the mountain and the members gathered around the local committee of entertainment and by hearty speeches and cheers fitly expressed thanks to the committee for the delightful time which its efforts and care had provided, and thus closed one of the most notable and agreeable conventions of the Society.

TRADE PUBLICATIONS.

The Christensen portable air compressor outfit is described in bulletin 1,513 of the Allis-Chalmers Co., Milwaukee. It consists of a motor-driven compressor with automatic governor and fuses, mounted with piping and air reservoir ,on a hand truck, so as to be easily transported to any part of a factory or yard where compressed air is required. The outfit is built in four capacities, for 11, 16, 20 and 50 cu. ft. of free air per minute, the maximum pressure being 100 lb.

A priced schedule of heating radiators has recently been issued by the McCrum-Howell Co., New York, which lists an extensive line of equipment manufactured for both steam and hot water heating. Standard designs of radiators are made in the one, two, three, four and six-column types and in a number of both plain and ornamental patterns. A specialty is made of the pin type of radiator for indirect heating.

A pamphlet devoted to generator valves has recently been issued by the Lunkenheimer Co., Cincinnati, Ohio, which describes interesting attachments for use in gasoline engines. There are also listed gasoline strainers, throttling valves, stop-cocks for gasoline, priming cups, relief cocks, drain cocks and gasoline cocks with spring keys to insure tightness without frequent and troublesome grinding.

An automatic sand and gravel elevator, described in a pamphlet from Shoemaker & Cascaris, Newcomerstown, Ohio, has for its purpose the loading of sand or gravel directly from the bank into cars, either with or without screening. It requires no spotting of the cars under the delivery spout, as it is designed to travel along a track parallel to the cars to be loaded to permit trimming the loads automatically. It is specially adapted for use in connection with concrete construction, although it is claimed that where large quantities of unscreened gravel are being used for railroad ballast, there is no apparatus manufactured that will load it as cheaply as this machine.

The advantages of drying brick and tile by waste heat from the burning kilns are set forth in a pamphlet recently issued by the Green Fuel Economizer Co., Matteawan, N. Y. Special exhauster fans manufactured by this company are adapted for handling the hot gases from the kilns during the periods of cooling off, and where a number of kilns are operated it is stated that a practically continuous supply of hot air may be obtained from them for drying the wet brick or tile fresh from the presses. Suggested arrangements of blowers, connecting ducts and drying houses are illustrated and views of large representative installations of this character are given.

Buffalo disk wheels, both motor and belt driven, are briefly described in a folder from the Buffalo Forge Co., Buffalo, N. Y. The electric disk wheels are kept in stock for immediate shipment, fitted with both General Electric and Peerless motors and wound for 110, 220 and 500 volts, direct current. The disk wheels are similarly kept in stock in all standard sizes fitted with pulleys for belt driving, and the capacities and power required for all sizes of wheels are stated in the folder.

The electrical equipment at the Hornell shops of the Erie R. R., is interestingly described in a pamphlet recently issued by the Westinghouse Electric & Manufacturing Co., Pittsburg, Pa. The power equipment is the result of a careful study of local conditions by Westinghouse, Church, Kerr & Co., with the result that an electrically-driven shop throughout was designed, the advantages of which are clearly set forth in the pamphlet.

The Buffalo Steam Pump Co., Buffalo, N. Y., has issued a leaflet stating the leadng features of shaft and mine pumps of the compound duplex and electrically-driven centrifugal types.

CONTRACTING NEWS

OF SPECIAL INTEREST TO
CONTRACTORS, BUILDERS, ENGINEERS AND MANUFACTURERS
ENGINEERING AND BUILDING SUPPLIES

WATER.

Notes Arranged Alphabetically by States.

Brundidge, Ala.—The City Clk. writes that the city is now in the market for water works material. Address A. J. Stewart, of Brundidge, Engr. in charge.

Newark, Del.—Bids are wanted until Aug. 3 for installing about 6,000 ft. 4-in. water mains. Address W. R. Kennedy, Newark.

Washington, D. C.—See "Miscellaneous."

Commerce, Ga.—The citizens are reported to have voted to issue bonds to the amount of $45,000 for water works and sewers.

Rome, Ga.—J. R. Cantwell, City Clk., writes that about $50,000 will be expended on water works and $25,000 for sewers. J. N. Hazlehurst, of Rome, is engineer in charge of work.

Elgin, Ill.—See "Power Plants, Gas and Electricity."

Chesterton, Ind.—Bids will be received by the Chesterton Water Co. (C. Jeffrey, Pres.), until Aug. 3 (extension of date), for the construction of water works, as advertised in The Engineering Record.

Louisville, Ky.—Bids will be received by S. Zorn, Pres. Louisville Water Co., 549 Third St., Louisville, until Sept. 8 for pumping engines, boilers, etc., as advertised in The Engineering Record.

Springfield, Mass.—Bids will be received by the Bd. of Water Comrs. until Aug. 21 for the construction of work included under Contract 1, intake dam and tunnel, Little River water supply, as advertised in The Engineering Record. E. E. Lochridge, Ch. Engr., Springfield; Hazen & Whipple, Consulting Engrs., 220 Bway., N. Y. City.

Fitchburg, Mass.—The City Council is reported to have passed an order on July 16 for an $80,000 water loan.

Pittsfield, Mass.—The Bd. of Aldermen is stated to have on July 15 passed an order appropriating $150,000 for the enlargement of the intake reservoirs of Sackett, Hatheway and Mill Brooks, also build new dam to increase city water supply.

Belle Plaine, Minn.—The Village Clk. will receive bids on a complete water works until Aug. 12. The work will comprise a steel tower and steel tank, distribution pipe line system, geared deep well gasoline engine and pump and brick building. Engineer Oscar Claussen, of St. Paul.

Winside, Neb.—Walter Gaebler, Village Clk., writes that the Eisentraut, Colby, Pottinger Co., of Sioux City, Ia., is preparing plans for water works, to cost about $10,000.

Fremont, Neb.—See "Power Plants, Gas and Electricity."

Ft. Hancock, N. J.—Bids will be received until Aug. 21 by Capt. M. N. Falls, Q. M., Ft. Hancock, for furnishing and placing a "Cook" strainer in deep well at this post.

Gloucester City, N. J.—Bids will be received until Aug. 1 by the City Council for furnishing and installing complete one low service 3,000,000 gal. horizontal direct-acting, duplex, compound, brass fitted, condensing steam pumping engine with appurtenances. Geo. C. Wynkoop, City Clk.

Long Island City, L. I., N. Y.—Bids will be received until Aug. 8 by Comrs. of Parks, N. Y. City (Moses Herrman, Pres.), for furnishing material and constructing a pumping plant in Forest Park, Boro. of Queens, together with all the work incidental thereto.

Carthage, N. Y.—It is stated that bids will be received until Aug. 6 by the Village Bd. for $3,000 water for $195,000 water bonds.

**East Hamburg, N. Y.*—The American Pipe Mfg. Co., Fidelity Bldg., Philadelphia, Pa., has awarded contract for the construction of a 10,000,000 gal. distributing reservoir at Windom near Buffalo (bids opened July 8) to Field, Barker & Underwood, Inc., 514 Arcade Bldg., Philadelphia, Pa. Engineer, J. W. Ledoux, 112 N. Broad St., Philadelphia, Pa.

Martinsburg, N. Y.—The Comrs. of the Martinsburg Water Dist. are reported to have petitioned the State Water Supply Comr. for permission to establish water works.

Dunkirk, N. Y.—See "Power Plants, Gas and Electricity."

Attica, N. Y.—Chas. B. Benedict, Pres. of the Bank of Attica, is reported interested in the construction of water works.

**Albany, N. Y.*—The lowest and successful bid opened on July 12 for straightening and improving Canaseraga Creek in Livingston County, was submitted by Graves & Stephens, Cleveland, O., at the following bid: 6 200 squares, cleaning and disposing of brush, per square, 10 cts.; cutting and disposing of trees, $4 to $10 ea.; 677,100 cu. yds. excav., 12 cts.; 10,200 cu. yds. earth fill, and embkmt., 25 cts.; 860 cu. yds. rock fill, and rip-rap in cribs and on slopes, $5; 15,000 lin. ft. round timber in cribs, including iron fastenings, 45 cts.; 80 m. ft. hemlock lumber for sheeting and grillage, $65; 40,200 ft. yellow pine lumber for bridges, $65; 400 foundation piles 15 ft. long, ea. $10; 1,690 cu. yds. Portland cement concrete, including forms, $10; 358,000 lbs. structural steel for bridges, including painting, 6 cts.; 3,800 lin. ft. wrought iron pipe, 1½ in. for railings on bridges, 20 cts.; total, $146,501. Totals of other bids: Pennell & O'Hern, Yonkers, $171,885, and Gilmore, Horton & Allen Co., Sandy Hill, $172,259. Walter McCulloh, of Niagara Falls, is Resident Engr., State Water Supply Comn.

Bemus Point, N. Y.—A water commission consisting of Fred Braker, John O. Johnson and O. W. Brownell, is reported to have been selected, to have charge of constructing water works; probable cost, $15,000.

** Items marked thus give the names of parties awarded contracts.*

Maxton, N. C.—J. M. Bandy, Consulting and Designing Engr., Laurinburg, has completed surveys for the proposed water works and sewerage system, to cost about $50,000.

Marion, O.—The Marion Water Co. of Marion is reported incorporated with a capital of $400,000, by Jas. T. Prendergrast, Wm. E. Scofield, Jas. G. Fairbanks and others.

Sayre, Okla.—The general contract for constructing water works at Sayre was on July 16th let to G. Jaeger, of Rich Hill, Mo., for $21,025. Other bidders: N. S. Sherman Machy. Co., Oklahoma City, Okla., $21,160, and Mellroy & Jones, Fayetteville, Ark., $21,400. The 50,000-gal. tank on 100-ft. tower was let to the Southwestern Bridge Co., of Joplin, Mo., for $2,898. Engineers, Burns & McDonnell, Dwight Bldg., Kansas City, Mo.

Johnstown, Pa.—The City Council is reported to have granted the Manufacturers Water Co. the right to lay mains through the city, as a link in the system to connect the Cambria steel works with the reservoir building at Quemahoning.

Philadelphia, Pa.—Bids will be received by Geo. R. Stearns, Dir. Dept. of Pub. Wks., until Aug. 22 for the improvement, extension and filtration of the water supply. Contract 102, preliminary filters at Torresdale, and Contract 108, Roxborough pipe extension system, as advertised in The Engineering Record.

**Etna, Pa.*—A. R. Dunbar, Boro. Clk., writes that the contract for constructing water mains on Locust, Pine and Butler Sts. (bids opened July 8), has been awarded to Francies & Davis, 290 Bellfield Ave., Pittsburg, for $1,212.

Manila, P. I.—Plans and specifications are on file at the office of The Engineering Record, 114 Liberty St., New York, N. Y., for certain valves and sluice gates for use in the gravity water supply of the city, bids for which will be received at the Municipal Board until Sept. 14, as advertised in The Engineering Record. J. F. Case, Ch. Engr.

Highmore, S. D.—See "Schools."

Temple, Tex.—See "Power Plants, Gas and Electricity."

Beaumont, Tex.—The Beaumont Water Works Co. of Beaumont is reported incorporated with a capital of $500,000. Incorporators, W. S. Davidson, A. L. Williams, M. K. Fletcher and others.

Salt Lake City, Utah.—City Engr. L. C. Kelsey is reported to have furnished the Water Works Com. of City Council an estimate of the cost of replacing the present 3-in. water mains on 2d Ave and a portion of 1st Ave. with 6-in. mains; probable cost $10,381.

Seattle, Wash.—Asst. City Engr. Scott is stated to have submitted report to Fire and Water Comr. of Council for a water main to supply South Park, which he estimates will cost bet. $20,000 and $25,000.

Sunnyside, Wash.—See "Power Plants, Gas and Electricity."

West Salem, Wis.—It is stated that bids will be received until Aug. 6 by the Village Bd. for $3,000 water works extension bonds.

Withee, Wis.—Bids will be received by Marius Andersen, Village Clk., until Aug. 2, for furnishing 2,600 ft. of 6 to 8-in. c. i. pipe, 7 hydrants, 3 6-in. valves, the work of laying the above amount of pipe and the erection of a 30,000-gal. steel tank and tower. For additional information apply to C. H. Phillips, Engr., of Marshfield, Wis.

SEWERAGE AND SEWAGE DISPOSAL.

Notes Arranged Alphabetically by States.

Huntsville, Ala.—The City Council is reported to have ratified ordinances providing for the paving of streets around the public square with brick, and extending the sewer system to East Huntsville.

Arkadelphia, Ark.—Bids will be received by the Comrs. of Sewer Dist. No. 1 until Aug. 15 for the construction of 45,280 ft. of clay pipe sewers, as advertised in The Engineering Record. Engineer, Theo. Hartman, 1122 Center St., Little Rock. J. E. Callaway, Sewer Comr.

Sacramento, Cal.—A resolution was introduced at a meeting of City Trus. on July 1, providing for a bond issue of $200,000 to complete the sewer system for the section south of S and N Sts. and east of 25th St., and for $75,000 bonds for levee raising and broadening from Front St. to Elvas Sta. An election will probably soon be held on question.

Lincoln, Cal.—The Town Trus. are reported to have adopted specifications for a sewerage system.

Truckee, Cal.—We are informed that bids will probably be received about Aug. 1 for the construction of a sewerage system. Engineer, E. C. Wren, of Nevada City, Cal.

**Bridgeport, Conn.*—The Pierce Mfg. Co., 95 Wall St., Bridgeport, is reported to have secured the contract for constructing the Wilmot Ave. trunk sewer (bids opened July 11) at $7.14 per ft.

**Torrington, Conn.*—Walter A. Williston, Boro. Engr., writes that the Pierson Eng. Co., of Bristol, has secured the contract for constructing sanitary sewers (bids opened July 16) at the following bid: 2,800 ft. 20-in. tile pipe, $4.50, 1,066 ft. 15-in., $4.80; 3,681 ft. 12-in., $1.02, 2,157 ft. 10-in., $1, and 10,876 ft. 8-in., 90 cts., and 76 manholes ea. $77 and rock excav. $7 per cu. yd. They also bid for 12-in. c. i. pipe $5.50 and 20-in. c. i. pipe $10, total amount of contract $42,137. Totals of other bids received were: A. W. Bryne Co., $49,952; F. H. Cowan Co., $61,432; Longhi Bros. & Mascetti, $74,389; Fred W. Stowers, $62,132; Eveline Bros., $78,345; F. T. Ley Co., $83,027, and Edw. McManus, $90,836.

**Norwalk, Conn.*—Chas. H. Dilsworth, of the Sewer Com., 45 Wall St., writes that bids were opened July 1 for constructing sewers, consisting of 20 lin. ft. 30-in. brick sewer, 314 lin. ft. 30-in., 468 lin. ft. 18-in., 3,118 lin. ft. 15-in., [illegible] lin. ft. 12-in. and 3,020 lin. ft. 10-in. stoneware pipe sewer, 75 manholes, 12 catch basins, [illegible] 6-in. Y [illegible] 150 cu. yds. solid rock excav., and the following are the totals of bids received: A. M. Cusack, [illegible] St., Boston, Mass., $21,888 (awarded contract); [illegible] Contr. Co., Boston, Mass., $25,270; John [illegible], So. Norwalk, $26,600; E. Chappa, Saugatuck, [illegible]; Michael Spino, Fishkill Landing, N. Y., $28,048; O'Rouke Co., Boston, Mass., $30,804; The Boston & N. Y. Contr. Co., Boston, Mass., $33,474.

New Haven, Conn.—Bids will be received until Aug. 1 at the office of C. W. Kelly, City Engr., for constructing sewers in portions of several streets.

Wilmington, Del.—Alex. J. Taylor, Engr. in charge of sewers, writes that the proposed sewer to be constructed in the lower end of the 9th Ward will be of concrete and cost about $25,000. It will be built by days work.

Wilmington, Del.—See "Paving and Roadmaking."

Washington, D. C.—See "Miscellaneous."

Commerce, Ga.—See "Water."

Rome, Ga.—See "Water."

Litchfield, Ill.—It is reported that the Bd. of Improv. has decided to build a single ring sewer, and will soon ask for bids for its construction.

Evansville, Ind.—W. F. Wunderlich, Clk. Bd. Pub. Wks., writes that bids will be received on Aug. 30 for constructing the Kentucky Ave. sewer; cost about $178,000. J. D. Saunders, City Engr.

Tipton, Ind.—The City Council is reported to have ordered plans and specifications completed and will soon ask for bids for the construction of a sanitary sewer; estimated cost, $30,000.

Lafayette, Ind.—Bids will soon be asked by the Bd. of Pub. Wks., according to reports, for the construction of the Congress St. sewer; estimated cost, $10,000.

Gas City, Ind.—It is reported that bids will be called for in a short time by the City Clk. for the construction of a general sewer system, to cost about $33,500.

Richmond, Ind.—Fred R. Charles, City Engr., writes that bids will be received on Aug. 9 for the construction of a subway on W. 2d St., and sewer system in connection with same; probable cost $40,000. C. N. Merrill, Pres. Bd. Pub. Wks.

Louisville, Ky.—Local press reports state that bids will soon be asked for by the Bd. of Sewer Comrs. for constructing the Happy Hollow sewer to extend from 21st to 27th Sts., north of High Arch; it will be of concrete and cost about $40,000. J. B. T. Breed, Ch. Engr., Sewer Comrs. Consulting Engineer, Harrison P. Eddy, of Worcester, Mass.

Togus, Me.—Bids will be received until July 31 by Maj. A. L. Smith, Treas. Eastern Branch, N. H. D. V. S., Togus, for furnishing material and improving sewerage and drainage system.

Westfield, Mass.—Bids will be received by the Bd. of Selectmen at the office of the Town Clerk until Aug. 3 for building sewers, to include about 3,250 ft. pipe sewer 8 to 18 in. diam. with manholes and catch-basins, as advertised in The Engineering Record. Oren E. Parks, Town Engr.

Iron River, Mich.—We are informed that only one bid was received and opened on July 17 for constructing sewers in Main Dist. No. 1, and the same was rejected. New bids will be received by Village Clk. until Aug. 7.

Austin, Minn.—Bids will be received until Aug. 2 by T. M. Foster, City Recorder, for constructing a sanitary sewer in a portion of Ash St.

**Bemidji, Minn.*—The Jerrard Plumbing Co., of Bemidji, is reported to have secured the contract for constructing 3,920 ft. of sewer and 12 manholes for $5,144.

Kansas City, Mo.—Bids will be received util Aug. 1 by the Bd. Pub. Wks. for constructing Joint Dist. Sewers in Dist. Nos. 2 and 3. E. A. Harper, City Engr.

Westfield, N. J.—Bids will be received until Aug. 5 by Town Council for constructing a trunk sewer from the sewage disposal works to a point near the Madison Hill Road, in Clark Township, a distance of about 2½ miles. Approximate amount of work to be done is as follows: 1 acre clearing and grubbing; 1,430 cu. yds. excav.; 570 cu. yds. embankment; 131 cu. yds. concrete in place; 1,070 lin. ft. 15-in., 1,860 lin. ft. 18-in., 7,890 lin. ft. 24-in. vitrified pipe in place; 1,150 lin. ft. 18-in. and 12 lin. ft. 24-in. c. i. pipe laid; 23 manholes, including covers; 31 sq. yds. dry paving on gravel. A. W. Vars, Town Surv., Broad and Elm Sts.; Lloyd Thompson, Town Clk.

Caldwell, N. J.—The Common Council is reported to be considering the question of constructing a sewerage system.

Orange, N. J.—Bids will be received until Aug. 5 by Willet B. Gano, City Clk., for constructing 1,100 ft. timber flume in the East Branch of Rahway River; also 375 ft. 15-in. storm sewer in Bell St. F. P. Crane, City Engr.

Trenton, N. J.—Bids will be received until Aug. 6 by the Common Council (H. Slater, Clk.) for constructing a sewer in portions of Stuyvesant, Parkside and Hillcrest Aves.; also a drain in a portion of Princeton Ave.

Jersey City, N. J.—The Bd. of Finance has appropriated $6,500 for protection of outlet sewer of Manhattan Ave. at the point where it passes Erie tunnel and open cut.

Madison, N. J.—An election will probably soon be held to vote on the question of constructing a sewerage system and disposal plant, to cost about $125,000.

Riverside, N. J.—I. Kollo, Township Clk., writes that Wm. H. Boardman, 427 Walnut St., Philadelphia, Pa., is engineer for the proposed sewage purification plant, which will cost about $70,000.

New York, N. Y.—Bids will be received until Aug. 6 by Henry S. Thompson, Acting Pres. Boro. Manhattan, and Comr. Pub. Wks., for furnishing material and constructing sewers in Fairview and Sherman Aves., W. 146th, W. 158th, W. 191st, W. 206th, Isham and Emerson Sts. Engineer's estimate: 3,414 lin. ft. salt-glazed vitr. stoneware pipe sewer, 15 in. interior diam.; 1,476 lin. ft. brick sewer, 2 ft. 6 in. x 2 ft. 4 in. interior diam.; 1,270 cu. yds. rock excav.; 11,250 ft. timber and planking for bracing and sheet piling; 10,237 ft. timber and planking for foundations, etc.

Summerville, N. Y.—Bids will be received until Aug. 5 by the Sewer Comn. (Chas. Salmon, Chmn.) for constructing a system of sanitary sewers.

Highland Falls, N. Y.—The Village Trus. are reported to have engaged Knight & Hopkins, of Rome, to prepare preliminary plans for a trunk sewer.

Brooklyn, N. Y.—Bids will be received until July 31 (readvertisement) by Bird S. Coler, Boro. Pres., for furnishing material and constructing relief sewer in Gold St., from Pierhead line to Johnson St., and in Johnson St., from Gold St. to Hudson Ave., section No. 1, division No. 2, Gold St. system. The Engineer's estimate of the quantities is as follows: Outlet Section A, 173 lin. ft; Outlet Section B, 40 lin. ft.; 1,910 lin. ft. 162-in., 1,431 lin. ft. 156-in. and 928 lin. ft. 150-in. circular sewer; 20 lin. ft. 3-ft. x 4-ft. 6-in. egg-shaped sewer, 24-in. 150 lin. ft. 18-in. 730 lin. ft., 15-in. 2,190 lin. ft. and 12-in. 4,645 lin. ft. all of pipe sewer, 30 lin. ft., 24-in. 130 lin. ft. 15-in., 205 lin. ft. 12-in. pipe temporary drain; 4,130 lin. ft., 12-in. pipe sub-drain, manholes, class "A," 3; class "B," 6; class "C," 2; manhole on 3 ft. x 4-ft. 6-in. egg-shaped sewer, 1; manholes on pipe sewer, 72; sewer basins reconnected, 53; sheeting and bracing, 1,100 M ft.; foundation and planking, 420 M ft. (B. M.); class B concrete, 1,000 cu. yds; bearing piles, 50,000 lin. ft.; pile capping, 15 M ft.; oak fender piles, 2,000 lin. ft.; yellow pine sheet piling anad wales, 260 M ft.; rip-rap or cobblestone fill, inside of coffer-dam, 2,280 cu. yds.; rip-rap, outside of coffer-dam, 370 cu. yds., etc. Security, $175,000. For list of bids received for this work on June 12 see issue of The Engineering Record, July 13.

Maxton, N. C.—See "Water."

**Bucyrus, O.*—The contract for sewage disposal plant at the Crawford County Infirmary, Bucyrus (bids opened July 19th) has been awarded to Martin Tiner and John Portman, Bucyrus, for $1,960. E. G. Bradbury and Geo. P. Shute, Engrs., 85 N. High St., Columbus.

Cleveland Heights, O.—Bids will be received until Aug. 20 by W. G. Phare, Village Clk., 204 Am. Trust Bldg., Cleveland, for furnishing material and constructing sewers in Fairmount Boule.

Youngstown, O.—Bids will be received until Aug. 2 by the Bd. Pub. Service (W. H. McMillin, Clk.) for constructing the Elm St. Dist. Sewer in portions of several streets.

Cleveland, O.—Bids will be received until Aug. 6 by the Bd. Pub. Service (A. R. Callow, Secy.) for furnishing material and constructing a reinforced concrete culvert for Giddings Brook under East Boule.

Cincinnati, O.—Bids will be received until Aug. 16 by the Bd. Co. Comrs. (Fred Dreihs, Clk.) for repairing culverts on Whiskey Run Rd., Springfield Township.

**Cresson, Pa.*—J. B. Rowlson, Clk. of Council, writes that the contract for constructing sewers (bids opened July 15) has been awarded to R. D. Malone, of Hollidaysburg, for $5,645.

Jenkinstown, Pa.—The question of constructing a sewerage system is reported under consideration here.

**Greenville, Pa.*—J. M. Hittle, Boro. Secy., writes that F. E. McQuiston, of Butler, has secured the contract for constructing sewers (bids opened July 16), for a total of $17,986.

Reading, Pa.—An ordinance has been introduced in Council providing for an issue of $40,000 bonds for the construction of the northeast intercepting sewer from 11th and Greenwich to 12th and Walnut Sts.; Rose Valley creek storm water sewer from Neversink and Culvert Sts to the Schuylkill River and Canal St. storm water sewer between 4th and 5th Sts.

St. Marys, Pa.—Bids will probably be called for in about 30 days for a sewerage system for St Marys, to cost about $60,000. Alex. Potter, of New York, N. Y., and T. Chalkley Hatton, of Wilmington, Del., are the Consulting Engrs.

Madison, S. D.—Bids will be received until Aug. 12 by the Regents of Educ. (Irwin D. Aldrich, Secy.), at Spearfish, for constructing a sewerage system at the Madison Normal School, Madison.

Ballinger, Tex.—The Sanitary Sewerage Co., of Ballinger, is reported incorporated; capital $20,000. Incorporators, Tom Ward, J. McGregor and W. A. Newman.

**Ritzville, Wash.*—John Fife, of Spokane, is reported to have secured contract to construct a complete sewer system for about $18,000.

Colville, Wash.—Bonds to the amount of $20,000 have been sold for the construction of a sewerage system. Bids for construction may be called for in Aug. or Sept. and may not be before next spring. Harry E. Bonner, City Engr.; A. B. Sansburn, City Clk.

Sutton, W. Va.—It is stated that bids will be received until July 31 by W. L. Armstrong, Recorder, for constructing about 2,400 ft. of sanitary sewer, laying about 4,500 lin. ft. curbing and about 12,000 sq. ft. brick paving.

Manitowoc, Wis.—Bids will be received until Aug. 3 by Arthur Reichert, City Clk., for furnishing material and constructing sewers in portions of 22d, Main, Chicago and 11th Sts.

Two Harbors, Wis.—Bids will be received until Aug. 5 by the City Council for $46,000 sewerage and drainage bonds. P. J. MacAlpine, City Clk.

Green Bay, Wis.—Bids will be received until Aug. 8 for 9,000 ft. brick or concrete sewers and 10,000 ft. vitr. pipe sewer, as advertised in The Engineering Record. W. W. Reed, City Engr.

Kaukauna, Wis.—Plans are now being prepared by G. P. Hawley, of De Pere, for 3,100 ft. of 10 to 30-in. sewers.

De Pere, Wis.—G. P. Hawley, of De Pere, is preparing plans for 2,000 ft. 8 to 15in. pipe sewers.

Toronto, Ont.—Bids will be received until July 30 by E. Coatsworth (Mayor), Chmn. Bd. Control, for constructing sewers in Doel Ave. and Rosedale Rd.

BRIDGES.

Notes Arranged Alphabetically by States.

Willows, Cal.—The Superv. of Glenn and Butte Counties, it is stated, propose constructing a bridge across Sacramento River near Hamilton City.

* *Items marked thus give the names of parties awarded contracts.*

Sacramento, Cal.—It is reported that M St. has been decided upon as the street at which the bridge for the accommodation of electric cars, teams and pedestrians is to be constructed over the Sacramento River.

**Fresno, Cal.*—The Pacific Constr. Co., 4 California St., San Francisco, is reported to have secured the contract for constructing concrete bridge over San Joaquin River at Skaggs' Crossing, at $44,297.

Stockton, Cal.—The Bd. of Supervisors are reported to have opened bids July 2 for construction 2 bridges on the Copperopolis Road, (*a*) Snow Bridge, (*b*) Upper Copperopolis Bridge: Canton Bridge Co., *a* $6,100, *b* $7,100; M. B. White, *a* $5,887, *b* $6,335; C. G. Sheely, *a* 5,414, *b* $6,296; Pacific Constr. Co., *a* $5797, *b* 6,997; Clark & Henery, *a* $5,900, *b* $7,000; Minneapolis Steel & Machinery Co., *a* $6,850, *b* $7,900, and Denver Bridge Co., *a* $6,182, *b* $6,998.

Waterbury, Conn.—It is stated that bids will be received by the Bd. of Pub. Wks. until July 30, for constructing steel concrete bridge over Mad River at Liberty St. R. A. Cairns, City Engr.

Brookland, D. C.—Bids will be received until Aug. 10 by the Comrs., D. C., at Washington, D. C., for constructing a concrete-steel bridge across the track of the B. & O. R. R. Co. on the line of Monroe St., Brookland, as advertised in The Engineering Record.

**Washington, D. C.*—With the approval of Gen. Mackenzie, Ch. of Engrs., Maj. Cosby the engineer officer in charge of the improvement of the Potomac River, it is reported, has made a contract with Chas. McDermott, of Washington, for the complete reconstruction of pier No. 1 of the Aqueduct bridge across the Potomac at a cost of $59,875. Bids for this work were opened July 11.

Boise, Idaho.—It is stated that the Bd. Co. Comrs. will receive bids until Aug. 5 for $44,000 bridge bonds.

Chicago, Ill.—Bids will be received until Aug. 17 by John J. Hanberg, Comr. Pub. Wks., for furnishing material and building in place all temporary work and furnishing material and labor required for the complete construction of the superstructure of a draw bridge over the west arm of the south fork of the south branch of the Chicago River at S. Ashland Ave.; also, same date and place, for constructing the substructure for said bridge; both proposals advertised in The Engineering Record.

Middleburg, Ind.—It is reported that the Bd. Co. Comrs. will receive bids until Aug. 6 at Brazil for constructing substructure and superstructure of a bridge across Eel River, west of Middleburg. Jas. L. Burnes, Co. Aud.

**Indianapolis, Ind.*—B. O. Hendricks, Secy. Co. Comrs., writes that the contract for constructing concrete bridges in Garfield Park, Brookside Park and Slades Park, (bids opened July 12) has been awarded to Hillis F. Hackedorn & Co., Indianapolis, for $16,000.

Tipton, Ind.—Bids will be received until Aug. 5 by the Bd. Co. Comrs. at Tipton for constructing an abutment and wing over Parker Branch Ditch, and an extension to the bridge south of the city of Tipton, known as the S. Main St. Bridge. J. F. Barlow, Co. Aud.

Covington, Ind.—Bids will be received until Aug. 6 by the Bd. Co. Comrs. at Covington for constructing 7 bridges in this county; also repairing the Perrysville grade. Wm. B. Gray, Co. Aud.

Warsaw, Ind.—Bids will be received until Aug 7 by the Bd. Co. Comrs. (Albert B. Warner, Chmn.) at Warsaw for constructing 4 steel bridges and 7 pairs of abutments. Bids to be submitted separately on each bridge or abutment.

**Clinton, Ia.*—The Milwaukee Bridge & Iron Co. Milwaukee, Wis., is reported to have been awarded a contract for a bridge over the Mississippi River at Clinton for the Chicago & North-Western R. R.

Des Moines, Ia.—The City Council is reported to have instructed the Bd. Pub. Wks. to receive bids for constructing a Melan arch bridge at Locust St.; probable cost, $100,000.

Atchison, Kan.—Bids will be received until Aug. 6 by the Bd. Co. Comrs. (J. C. Hotham, Chmn.) at Atchison for constructing a 120-ft. steel bridge (three 40-ft. spans) on concrete foundation, on the line between Atchison and Jefferson Counties; also a 20-ft. steel briige on concrete foundations in Mt. Pleasant Township. L. S. Hereford, Co. Engr.

Franklinton, La.—It is reported that bids will be received Aug. 2 by the Police Jury for constructing 3 steel bridges, at Warnerton and at Isabel, on Bogue Chitto River and at Bogalusa on Bogalusa Creek.

Shreveport, La.—P. B. Hill, of Benton, La., Clk. of Police Jury of Bosier Parish, writes that Ira G. Hedrick, of Kansas City, Mo., is preparing plans for the proposed bridge to be constructed over Red River at Shreveport; cost $125,000 to $200,000.

**Havre de Grace, Md.*—The contract for the substructure of double track B. & O. R. R. bridge across Susquehanna River at Havre de Grace is stated to have been awarded to Eyre-Shoemaker, Inc., of Philadelphia, Pa. The contract for the superstructure was awarded a few weeks ago, according to reports, to the American Bridge Co., of New York, N. Y. This bridge will be double track throughout, require about 45,000 cu. yd. of masonry in the substructure and between 14,000 and 15,000 tons of steel in the superstructure. It will be 7,000 ft. in length, require about three years to build, and cost about $2,000,000.

Williamsport, Md.—Mason D. Pratt, of Harrisburg, Pa., has been appointed Chief Engr. of the Washington & Berkeley Bridge Co., of Williamsport, Md., and is now making plans for a reinforced concrete arch bridge across Potomac River at the above point. The bridge will be about 1,500 ft. long, and will be designed to carry a double track interurban trolley line which it is expected in the near future will be built from this point to Martinsburg, W. Va. Mr. Pratt expects to have plans and specifications ready for bidding in about 2 months.

Barnstable, Mass.—Alfred Crocker, Clk. Bd. Comrs. of Barnstable County, writes that all bids opened on July 15 for building steel bridge on masonry piers and abutments to replace present bridge across Bass River, betw. Yarmouth and Dennis and for filling in and constructing a road over a portion of said bridge have been rejected. The following were the bids received: (*a*), substructure; (*b*), superstructure: W. H. Ellis, Boston, Mass, *a*, $29,050; *b*, $15,244; The United Constr. Co., Albany, *b*, $13,850; Berlin Constr. Co., Berlin, Conn., *b*, $14,957; John A. Gill Co., Hull, Mass., *a*, $27,840.

**Jameson, Minn.*—It is stated that the Bd. of Superv. of the town of Jameson has awarded the contract to construct a-1 span steel bridge on 2 wooden piers over Littlefork River, between sections 9 and 10, to the Hennipen Bridge Co., of Minneapolis, at $6,000.

Senatobia, Miss.—Bids will be received until Aug. 5 by the Bd. Co. Superv. (J. A. Wooten, Clk.) at Senatobia for constructing a steel bridge across Coldwater River, known as the Love Bridge.

Greenwood, Miss.—It is reported that bids will be received until Aug. 5 by C. W. Crockett, Co. Clk., for constructing a bench bridge 63 ft. long on Dalmer's Pl.

Trenton, N. J.—City Engr. Swan is reported to be preparing plans for a bridge to carry Seward Ave. across the Belvidere division of the Pennsylvania R. R. to connect with Perrine Ave.

Le Roy, N. Y.—E. Townsend, Town Clk., writes that it is proposed to construct bridge over Oatka River on Main St.; cost reported to be $10,000.

**Ft. Plain, N. Y.*—The Canton Bridge Co., of Canton, O., is stated to have secured the contract to construct the iron bridge over Gavage Creek in town of Palatine, for which the citizens on July 16 voted in favor of issuing $4,500 bonds.

Chillicothe, O.—It is stated that bids will be received by the Co. Comrs. until August 5 for constructing 30-ft. steel bridge, with 14-ft. roadway, on iron substructure incased in concrete. C. H. Pinto, Co. Aud.

**Cincinnati, O.*—A. Desch & Son are reported to have secured the contract for constructing a bridge over the Ohio Pike at Ferris for $15,940.

Carrollton, O.—It is stated that bids will be received until Aug. 5 by N. L. Marshall, Co. Aud., for constructing an iron bridge 50 ft. long over Conotton Creek.

**Pendleton, Ore.*—It is reported that P. S. Easterly & Co., of Walla Walla, Wash., have been awarded the contracts to build the steel bridges, one near Milton, connecting the upper county road running between Walla Walla and Milton, and the steel brdge across McKay creek, 7 miles south of Pendleton, at $2,650 and $2,984, respectively.

Hamburg, Pa.—Bids will be received until Aug. 9 by H. F. Livingood, Co. Compt., at Reading, for constructing a reinforced concrete arch bridge, 40 ft. span, with 2 abutments and 4 wing walls over Mill Creek, Hamburg.

Charleroi, Pa.—The new bridge between Charleroi and Pittsburg over the Monongahela River is stated to have been wrecked by the recent flood caused by heavy rains.

Greenville, S. C.—H. R. Fothergill, of Greenville, Gen. Mgr. of the Greenville Traction Co., writes that the City Engineer has prepared plans for a bridge across Reedy River to be constructed jointly by city and railway company; according to reports it will be a 3-arch concrete bridge and cost about $25,000. Contract has not yet been let.

Spokane, Wash.—The construction of a viaduct over the railroad tracks on N. Division St. is reported contemplated, at a cost of $180,375.

Fond du Lac, Wis.—It is stated that the Bd. Pub. Wks. has been authorized to construct an iron bridge at Grove St., also to repair the bridge over the river at Brooke St.

Hamilton, N. Z.—Waddell Harrington, New Nelson Bldg., Kansas City, Mo., is reported to have been selected to prepare plans for a bridge over Waikato River, in Hamilton, to cost $125,000.

St. Catherines, Ont.—Bids will be received until July 31 by the Dept. Railways and Canals (L. K. Jones, Secy.), Ottawa, for the substructure of the new bridge crossing the Welland Canal on the line of Queenston St., St. Catherines.

PAVING AND ROAD MAKING.

Notes Arranged Alphabetically by States.

Huntsville, Ala.—See "Sewerage aand Sewage Disposal."

**Tuscumbia, Ala.*—The contract to construct 13,190 sq. yds. of cement sidewalks is stated to have been awarded to the Adamant Stone & Paving Co., of Nashville, Tenn., at 13.77 cts. per ft.

Montgomery, Ala.—Bids will be received until Aug. 5 by R. S. Williams, City Treas., for paving sidewalks on portions of 4 streets with Hexagon block or Schillinger pavement.

Oakland, Cal.—Superv. Bridge, it is stated, will soon submit to the Superv. a proposition to complete the foothill boule., from the western terminus, 1,500 ft. west of High St. to the city limits. The cost will be about $30,000, and the Superv. will be asked to appropriate $20,000.

Central City, Colo.—It is stated that bids will be received Aug. 2 by T. W. Jaycox, State Engr., Denver, for constructing a wagon road from Tollan to American City.

Killingly, Conn.—Bids will be received until July 31 by the Bd. of Selectmen (John A. Gilbert, 1st Selectman), for constructing a gravel road.

New Haven, Conn.—Bids will be received until Aug. 5 at the office of C. W. Kelley, City Engr., for paving with crushed stone and Belgian block gutters, portions of Prospect, Sachem and Plymouth Sts.

Smyrna, Del.—The Street Com. has been directed to have the principal streets of the city macadamized.

Wilmington, Del.—Bids will be received by the Bd. Directors Street and Sewer Dept. (L. V. Christy, Secy.) until July 30 for furnishing the following materials, which may be required for a period of 1 year from Aug. 1, 1907: Blue gutter stone, foreign and domestic Portland cement, terra cotta pipes, castings, sewer bricks, sidewalk paving bricks, bar sand and river paving sand and gravel.

*Stewart & Donohue, of Wilmington, are stated to have secured the contract to construct road from Mt. Pleasant to Boyd's Corner, a distance of 3.46 miles, for $22,891, and road from Mt. Pleasant Station to Summit Bridge, a distance of 2.35 miles, for $16,035 (bids received July 9).

Bids will be received by the Bd. Dir. Street and Sewer Dept. (L. V. Christy, Secy.) until Aug. 2 for grading, furnishing of material and paving of 5,000, 7,500, 10,000, 20,000, 30,000, 50,000 or 75,000 sq. yds. of either sheet asphalt, bituminous, macadam, bitulithic or Portland cement concrete pavement.

Pensacola, Fla.—Bids will be received by the Bd. of Bond Trus. (L. Hilton Green, Chmn.) until Aug. 27 for grading, paving and curbing certain streets, consisting of approximately 170,700 sq. yds. clay or shale block, asphalt, bitulithic, wood block or macadam, and 115,950 lin. ft. concrete curb, as advertised in The Engineering Record. T. Chalkley Hatton, Ch. Engr., Wilmington, Del.

Rome, Ga.—J. R. Cantwell, City Clk., writes that about $225,000 will be expended for paving. Engineer in charge of work is J. N. Hazlehurst, of Rome.

**Savannah, Ga.*—The City Council is reported to have decided to award the contract for repaving with asphalt portions of Broughton, Bryan, Congress, Harris, Liberty, St. Julian, Bull and Drayton Sts., to the Southern Paving & Constr. Co., for 122,297, and for repairing asphalt pavements on Drayton, Oglethorpe Ave., President and York Sts., for $4,997.

East St. Louis, Ill.—Bids will be received until July 30 by the Bd. Local Improv. (E. J. Eggman, Clk.), for paving 24th St., requiring 2,850 sq. yds. vitr. brick pavt. on a 6-in. concrete foundation, 1,742 lin. ft. combination granitoid, guttering and curbing, etc.

Quincy, Ill.—The City Council has passed an ordinance to pave 10th St., from Oak to Sycamore Sts., at an estimated cost of $25,581.

**McLeansboro, Ill.*—The Bd. of Local Improv. is stated to have awarded the contract to pave the principal streets of the city (bids for which were received July 9) to John Cherry, of Jacksonville, Ill., at $96,000.

Chicago, Ill.—Bids will be received until Aug. 5 by the Bd. of Local Improv. (H. S. Dietrich, Pres.) for repairing brick, asphalt and granite block pavement on sundry streets.

**Oak Park, Ill.*—B. C. Brandstadt, Secy. Bd. of Local Improv., writes that C. D. Smith, of Oak Park, and Edw. Holmstead, of Austin Sta., Chicago, have secured the contract for concrete sidewalks (bids opened July 16), at 12, 13 and 14 cts. per sq. ft. There will be about 169,000 sq. ft. of walks laid.

Beardstown, Ill.—It is stated that bids will soon be received for street paving in Beardstown, at a cost of about $80,000.

Martinsville, Ind.—It is reported that the Bd. Co. Com. will receive bids until Aug. 6 for the construction of about 2½ miles of gravel and macadam road in Ray Township. E. E. Thornburg, Co. Aud.

Rockville, Ind.—It is reported that the Bd. Co. Comrs. will receive bids until Aug. 7 for the construction of the Crooks and Wimer Rd., Union Township; Penee Rd., Wabash Township, and the Union Chappel Rd., Washington Township, comprising an aggregate of about 11 miles. H. A. Henderson, Co. Aud.

Columbus, Ind.—It is reported that the Bd. Co. Comrs. will receive bids until Aug. 5 for the construction of 1½ miles of gravel road in Clifty Township. John M. Davis, Co. Aud.

Hartford City, Ind.—It is reported that the Bd. Co. Comrs. will receive bids until Aug. 8 for constructing a macadam road in Harrison Township, known as the Neal Rd. L. N. Daugherty, Co. Aud.

Washington, Ind.—It is reported that the Bd. Co. Comrs. will receive bids until Aug. 6 for constructing a rock road known as the Harris Rd.; also 3 gravel roads known as the Alex. Moore, Fairhurst and Stoy Roads, respectively. Thos. Nugent, Co., Aud.

Columbus, Ind.—It is stated that bids will be received by the Co. Comrs. until Aug. 5 for constructing 1½ miles of gravel road in Clifty Township. John M. Davis, Co. Aud.

Muncie, Ind.—It is reported that petitions have been filed for the construction of a number of gravel roads in Delaware County, aggregating about 20 miles. Joe E. Davis, Co. Aud.

Clarinda, Ia.—Bids will be received by C. W. Stuart, City Clk., until Aug. 6 for about 11,398 lin. ft. concrete curb and gutter; also for a 7x7x80 ft. reinforced concrete culvert, as advertised in The Engineering Record.

Des Moines, Ia.—The Council, it is reported, has voted to pave [illegible] St. with brick.

Showhegan, Me.—It is stated that bids will be received by the Co. Comrs. until Aug. 5 for constructing highway from The Forks to Lake Moxie Station.

**Baltimore, Md.*—This city is adding 1,740 sq. yds. of bitulithic to the contracts previously awarded. Warren Bros. Co., of Boston, Mass., will do the work.

*The contract for paving a portion of Belle Ave. is reported to have been awarded to P. Flanagan & Sons, Lexington and Calvert Sts., for $5,622.

Bids will be received until July 31 by J. Barry Mahool, Pres. Bd. of Awards, for curbing and paving with sheet asphalt, asphalt blocks, vitrified bricks or bitulithic, Robert Ave. and Lombard St.

**Boston, Mass.*—Jones & Meehan, 10 Tremont St., have secured the contract for paving draw span and spans 1, 2 and 3 of Northern Ave. Bridge (bids opened July 22 by Wm. Jackson, City Engr.) at $29,685 and 10 cts. per yd. for road pitch furnished and poured. Lawler Bros., 16 City Sq., Charlestown, Mass., bid $31,798 and 18 cts. and Patk. McGovern, 6 Beacon St., $32,900 and 15 cts.

Fremont, Neb.—J. W. Andrews, City Engr., writes that plans have not yet been completed for the proposed municipal water and light station, which will cost about $60,000. Contracts for engines and dynamos have been let. E. N. Morse, Chmn. Bd. of Pub. Wks. Chas. A. Chapman, 204 Dearborn St., Chicago, Ill., is Consulting Engr.

Tecumseh, Neb.—Frank L. Densmore, City Clk., writes that John Martz, of Seward, is preparing plans for the proposed electric light plant, to cost about $20,000.

Newark, N. J.—The Common Council on July 12 appropriated $30,000 for the installation of an electric plant in City Hall, and also decided to have the people vote next Nov. on the question of the city building a $1,000,000 plant for the lighting of the streets. The Mayor has signed both resolutions. The new contract with the Public Serivce Corporation will run until Sept, 1912.

Brooklyn, N. Y.—Bids will be received until Aug. 5 by C. B. J. Snyder, Supt. School Bldgs., N. Y. City, for installing electric equipment of addition to and alterations in School 129, Boro. of Brooklyn.

**New York, N. Y.*—The following are the bids opened on July 15 by the Armory Board for furnishing and installing electric lighting fixtures, etc., in the 12th Regt. Armory, Boro. of Mahattan: Jas. Ahearn, $7,769; Isidore Fajane, $6,850; Wm. M. Sheehan & Co., $8,198, and J. M. Knoop, $6,755 (awarded contract).

Blackwell's Island, N. Y.—Bids will be received until Aug. 5 (readvertisement) by Robt. W. Hebbard, Comr. of Pub. Charities, N. Y. City, for materials and labor required for complete conduiting, electric wiring, and all other work in connection with the installation of a complete electric lighting and power system for buildings and grounds under jurisdiction of Dept. of Pub. Charities and comprising the Metropolitan Hospital Dist., Blackwell's Island, Boro. of Manhattan.

We are informed that no bids were received for the above work on July 18.

**Dunkirk, N. Y.*—The Water Comrs. are reported to have awarded to the Allis-Chalmers Co., of Milwaukee, Wis., the contract for a 500-kw. turbo-generator for the water works and electric light plant for $19,500.

Norwich, N. Y.—The State Gas and Electric Comn. at Albany is reported to have granted the Oriskany Hydro Electric Co., of Utica, permission to carry on business in the counties of Oneida, Madison and Chenango. It proposes to build an electric power line and railroad from the terminus of the Mohawk Valley line out of Clinton, south to Norwalk. E. H. Risley, of Utica, is reported to be one of the promoters.

Hickory, N. C.—It is stated that bids will be received until Aug. 10 by M. E. Thornton, Hickory, for constructing a concrete rock reinforced dam with power house, across the Catawba River, at Hickory, and installing 3,000-h.p. turbine water-wheels and electrical apparatus and transmission lines for lighting and power purposes.

Randleman, N. C.—See "Electric Railways."

Forest Grove, O.—The Haines Electric Power Co. (E. W. Haines, Mgr.), is reported to be considering the question of developing power, getting 500 ft. head and installing more machinery.

Wilkesbarre, Pa.—The Wilkesbarre Subway Light & Power Co. is reported formed, and has applied to the State for a charter. Dr. Lewis Edwards, County Treas; Frank Darte, an attorney, and Reese Lloyd, a real estate agent, are reported to be among the incorporators. It is stated that the company will not build a plant of its own to generate power, but the same will be obtained from a substation, probably the Laurel Line Co.

Providence, R. I.—A committee is reported to have been appointed consisting of C. D. Kimball and Robt. S. Burlingame, to look into the matter of constructing an electric lighting and heating plant at Rhode Island College; cost about $7,000.

Mitchell, S. D.—John Absher, of Wagner, S. D., Pres. Wagner, Lake Shore & Armour Traction Co., writes that the company is now constructing light and power plants at Armour, S. D., and Plate, S. D., and expect to commence work at Mitchell about Sept. 1st. Will soon commence the construction of 70 miles of suburban line from Wagner to Mitchell, 20 miles, of which right of way has been procured. Will be in the market for 56-lb. rails for this line in the near future, having already negotiated for ties and machinery.

Hubbard City, Tex.—Eugene Sheridan, of the Union Central Light & Ice Co., of Hubbard City, writes that this company is about to construct a plant to supply four of the neighboring towns with electricity, etc., and have issued $25,000 bonds for same. The company wants a construction company or engineer to build, taking the bonds at 85 per cent. net, and would be glad to hear from contractors or engineers direct.

San Angelo, Tex.—John Freeland, of the San Angelo Gas Co., writes that bids will be received until about Aug. 15 for improving the gas plant; cost about $50,000.

Temple, Tex.—The Rogers Water & Light Co., of Temple, is reported incorporated with a capital of $50,000 by John J. Cox, R. L. Brown and others.

Floresville, Tex.—A. W. Strange is reported interested in the construction of an electric light plant.

Sunnyside, Wash.—T. A. Noble, of North Yakima, is reported to have petitioned for a franchise for water works and an electric light plant.

Lander, Wyo.—The Lander Light & Power Co. (E. Amoreth, Jr., Mgr.), is reported to have decided to expend $15,000 in improvements.

ELECTRIC RAILWAYS.

Notes Arranged Alphabetically by States.

Redding, Cal.—It is stated that F. L. Evans has made formal apolicaion to the City Trustees for a franchise authorizing him to operate a double-track electric railway through enumerated streets of Redding, the same to become, ostensibly, a part of the system of the Eureka & Redding Ry., or the Inland Empire.

Canon City, Colo.—The Canon City, Pueblo & La Junta Ry. & Power Co., it is stated, discussed plans and decided to open offices in Pueblo at once and commence the work of building and equipping an electric interurban railway which will extend from Canon City to the Kansas State line. Alfred E. Bent, of Lamar, Pres.; Andrew J. Behymer, of Elwood, Ind., Gen. Mgr.; Geo. D. Kendall, of Pueblo, Secy.; F. E. Pastorius, of Colorado Springs, Treas.

Cairo, Ill.—The Secretary of State is reported to have issued a license to incorporate the Cairo Terminal Traction Co. The road is to be constructed from Cairo to the north line of Pulaski County. The incorporators: L. E. Fischer, Danville, general manager of the Illinois Traction system; Dan Hogan, Mound City, and Judge W. S. Dewey, D. H. Sawyer and H. F. Vogel, all of Cairo.

Charleston, Ill.—The Secretary of State is reported to have issued a license to incorporate the Charleston, Westfield, Marshall & Terre Haute Interurban Ry. Co. It is proposed to construct an interurban road from Charleston, by way of Westfield, through the counties of Coles and Marshall to the Indiana State line, where it crosses the National Road. The principal office is Marshall. Capital $5,000. Incorporators, James Dawson, William B. Schofield, T. M. Berkeley and others.

Sullivan, Ind.—The Board of Comrs. of this county is stated to have granted a franchise to the Terre Haute & Merom Traction Co. The proposed road passes through Fairbanks, Staffordshire, Graysville, Merom and Merom Junction.

Terre Haute, Ind.—A petition is stated to have been filed with the Comrs. of Vigo County for a franchise for the Terre Haute & Merom Traction Co., which proposes to build a line through the county to connect Terre Haute and Merom. The 18 miles of road will be built on private right of way as near as possible.

Marion, Ia.—The American Motor-Car Interurban Ry. Co., of this city, is stated to have filed articles of incorporation with the Secretary of State. Capital, $10,000. The principal nature of the business to be transacted is the acquisition by lease of purchase and the construction, operation and maintenance of interurban and street railways to be operated either by electricity or by self-propelled motor cars. The company first proposes to construct an interurban railway from Marion to Muscatine via Davenport. E. J. Christie, of Marion, Pres.; John T. Christie, of Marion, is Secy. and Treas.

Mayfield, Ky.—A. J. Watts, Mayor of Mayfield, is reported to have sold a street railway franchise to J. W. Williams, of the firm of J. W. Williams & Co. It is reported that in less than about 6 months work will begin on an interurban street railway from Paducah to Mayfield.

Waterville, Me.—The Easton & Wyman water-power privilege on Sebasticook River near Ft. Hill Cemetery in Winslow is reported to have been purchased by the Augusta & Waterville Electric Ry. Co., and the contract for the erection of a dam will soon be awarded. The dam and power station will cost $130,000.

Williamsport, Md.—See "Bridges."

Baltimore, Md.—The Baltimore, Frederick & Hagerstown Electric Ry. Co. is reported to be planning extensions into the coal fields of Maryland and possibly West Virginia and Pennsylvania. The plan, it is understood, proposes making the road an extensive freight-carrying line, and is said to involve an expenditure of $25,000,000. Surveys already made are for a low-grade line. Capital, $15,000,000.

**Boston, Mass.*—The contract for constructing entrances and exits at Winter St. for Washington St. Tunnel (bids opened July 18) has been awarded to Patk. McGovern of 6 Beacon St., for $23,289.

Minneapolis, Minn.—The Minneapolis, Kansas City & Gulf Railway Co., with headquarters at Minneapolis, it is reported, is planning to build a double-track railway operated by electricity from Minneapolis to the Gulf. C. D. Holmes, G. A. Barnett and others are interested in the project.

Kansas City, Mo.—The Kansas City, St. Joseph & Excelsior Springs Electric Ry. is stated to have introduced an ordinance in the City Council to build a tunnel under Locust and Cherry Sts. from 3d St. to the Belt Line.

Randleman, N. C.—A franchise is stated to have been granted to the Randleman Electric Ry. Co. The company proposes to begin at once the erection of a power plant to furnish light and power for the city.

Toledo, O.—It is stated that the Summit Street line of the Toledo Ry. & Light Co. (J. T. Ross, Ch. Engr.) between Michigan and Ohio Sts. will be double tracked this summer.

Defiance, O.—The Defiance, Paulding & Ft. Wayne Railway Co. is reported organized to build an electric railway between Defiance and Ft. Wayne, following the bed of the old Wabash & Erie canal.

Enid, Okla.—A charter is stated to have been issued to the Enid, Blackwell & Osage Interurban Traction Co., of Enid, with $1,000,000 capital, to build 85 miles from Enid to Pawhuska, through the counties of Garfield, Kay, Noble and Osage. Incorporators Geo. W. Bear, Frank Bradfield, S. J. Hudkins, John R. Clover and Guy S. Manatt, all of Enid.

Enid, Okla.—The Enid, Waukomis & Oklahoma City Interurban Ry. Co. is reported incorporated for the purpose of building an electric railway 100 miles in length. R. W. Birttan, of Waukomis, is Pres.

Sayre, Pa.—The Boro. Council is reported to have granted the Waverly, Sayre & Athens Traction Co. permission to extend its lines through the borough.

Harrisburg, Pa.—It is stated that the 2d St. line of the Central Pennsylvania Traction Co. (W. J. Calden,

** Items marked thus give the names of parties awarded contracts.*

Secy. Harrisburg), will be extended from Maclay to Division Sts. within the next year.

Mitchell, S. D.—See "Power Plants, Gas and Electricity."

Memphis, Tenn.—The Clarksdale-Collierville-Covington Interurban Ry. Co. is reported to have filed in the office of the County Register a petition by R. F. Tate, C. F. Farnsworth, A. Walsh, and others for a charter; capital, $50,000. The company is to be a subsidiary of the Lake View Traction Co., and is organized for the purpose of securing franchises for the Memphis-Clarksdale Interurban lines.

Austin, Tex.—The Texas Interurban Co. is stated to have filed its charter. The purpose of the company is to build a system of interurban electric railways with Austin as the center. Capital, $400,000. The incorporators: Thos. Moore, of Elizabeth, N. J.; Ephriam Miller, of White Plains, N. Y.; C. P. Scrivener and S. M. Posey, of Austin. It is announced by the company's representatives that it will soon begin the construction of an interurban line to run from Austin to Lockhart, a distance of about 30 miles. The survey for the proposed road has been made and the right of way obtained for most of the distance.

New Westminster, B. C.—An application is reported to have been made to the City Council by the Burrard, Westminster & Boundary Ry. & Navigation Co., which plans to build an electric railroad to Seattle from this city.

Yarmouth, N. S.—The Hood-Godfrey Electric Ry. Co. has secured a franchise from City Council to construct an electric double track railway from Cumberland to Cliff Sts. A terminal is to be constructed at Cumberland St., while shops, power house, etc., will be erected on the Swain property at the other end of line. A. J. Haines, Pur. Agt., is now in St. John, N. B., attending to the supply of ties. The Ch. Engr., has completed surveys. T. W. Carten, Pres.; Jesse C. Robbins, Secy.; S. C. Hood, Jr., Treas. Work will be started about the middle of Sept., when contracts will be let.

RAILROADS.

Notes Arranged Alphabetically by States.

**San Francisco, Cal.*—The Western Pacific R. R. Co. is reported to have awarded to the Western States Construction Co. (H. A. Whitely, Pres.) the contract for work at a cost of $1,000,000, which includes grading road from 25th St., in the Potrero where it touches Islais Creek, north and northwesterly to 9th and Brannan Sts. On this route one short tunnel will have to be bored through Potrero hills. The company also awarded to Healy & Tibbitts, a contract at $700,000 the work to include building a freight slip and passenger slip on Oakland water front adjoining north wall of Oakland estuary and dredging to proper depth; to also prepare foundations for freight and passenger structures to be used in connection with slips; finish filling in of mole, to be 1,000 ft. wide and 1,000 ft. long.

Cannel City, Ky.—The Ceny, Piedmont & Moorehead R. R. Co. is reported incorporated, to construct a railroad bet. Cannel City and Piedmont; capital, $100,000. Incorporators: S. J. Gish, Central City; V. J. Blow, Nashville, Tnn.; E. C. Hegan, Louisville, and others.

Portland, Me.—The Portland, Gray & Lewiston R. R. Co. is reported incorporated, to construct, operate and maintain a street railroad of standard gauge in Portland, Westbrook, Falmouth, Cumberland, Gray, New Gloucester, Auburn and Lewiston; total length of the road, about 40 miles; capital, $160,000. Directors: Edw. W. Gross, Auburn; Chas. C. Benson, Lewiston; Lewis A. Goudy, Portland; John D. Clifford, Lewiston, and others.

Perry, Okla.—An amended charter has been granted to the Cherryvale, Oklahoma & Texas R. R. to build 700 miles southwest from Cherryvale, Kan., to El Paso, Tex. The following branch lines are provided: From Caney, Kan., to Fayetteville, Ark., 150 miles.; from Pawhuska, Okla., to So. McAlester, Ind. Ter., 200 miles, and from Childress, Tex., via Abilene, to Aransas Pass, Tex., 600 miles. Headquarters are established at Caney, Kan., and Independence, Kan., and Perry, Okla., with $18,000,000 capital stock. Incorporators: S. M. Porter, of Caney, Kan.; A. W. Shiltise, F. D. and J. H. Brewster, of Independence, Kan.; R. E. Wade and John H. Masters, of Perry, Okla.

Butler, Pa.—The Baltimore & Ohio R. R. Co. (D. D. Carothers, Ch. Engr., Baltimore, Md.) is reported to be planning extensive improvements at Butler. New freight and passenger stations will be erected and yard trackage and freight facilities enlarged.

Knoxville, Tenn.—Application has been made for a charter for the Knoxville, Sevierville & Eastern Ry. Co., with a capital of $500,000, to build to Sevierville, via Rockford, N. C., through the North Carolina line and eventually to Rutherford, N. C. Incorporators: S. B. Luttrel, Wm. P. Chamberlain, D. M. Rose and others.

PUBLIC BUILDINGS.

Notes Arranged Alphabetically by States.

**Tuscumbia, Ala.*—The Co. Comrs., it is stated, have awarded the contract to erect a jail (bids for which were received July 15) to the Stewart Iron Wks., of Cincinnati, O., at $11,872.

Birmingham, Ala.—The erection of a library to cost about $200,000 is reported under consideration.

Little Rock, Ark.—Bids will be received until Aug. 5 by the Bd. State Charitable Institutions (H. T. Hampton, Secy. and Purchasing Agt.) for erecting the following buildings at the Arkansas Hospital for Nervous Diseases: 1 ward building, 1 cow barn, 1 milk house and additions to the hospital. Gibb & Sanders, archts., Reider Bldg.

Colorado Springs, Colo.—The following are the bids opened on July 9 at the office of the Superv. Archt., Treas. Dept., Washington, D. C., for construction (including plumbing, gas piping, heating apparatus, electric conduits and wiring), of the U. S. Postoffice and Court House at Colorado Springs: John Barden, Ft. Worth, Tex., $236,600; Campbell Bldg. Co., Salt Lake City, Utah, $207,700, and J. H. Wiese, So. Omaha, Neb., [illegible].

Pueblo, Colo.—F. W. Cooper, of Pueblo, is said to be preparing plans for a 2-story woman's department building to be erected at the State Insane Asylum at a cost of $50,000. It is stated that bids for the construction will be asked soon.

Stonington, Conn.—Bids will be received at the office of the Light House Engr., Tompkinsville, S. I., N. Y., until Aug. 15 for erecting a keeper's dwelling at Stonington Breakwater Light Station, Conn, as advertised in The Engineering Record.

Washington, D. C.—See "Miscellaneous."

**Washington, D. C.*—The Veneered Door Co., of Athens, O., has secured the contract for corridor and special doors, etc., with jambs, transom, sashes, etc., for House Office Building (bids opened July 10 at the office of Elliott Woods, Supt. U. S. Capitol Bldgs. and Grounds). Bids opened same time for 499 communicating and closet doors were rejected.

The Federal Co. will enlarge the present plant and build additional works for the recovery of rubber from rubber waste at a site where water and good shipping facilities are available.

Cuba City, Wis.—Plans are reported prepared for a mill to be erected in Cuba City by the Vandeventer Lead & Zinc Co., and provide for a 50-ton concentrator.

Hamilton, Ont.—Plans are reported being prepared by Stewart & Witton, of Hamilton, for a $75,000 building for the Canada Steel Goods Co., Ltd., of Hamilton.

Chatham, Ont.—It is reported that the by-law to grant a loan of $20,000 to the Wolverine Brass Goods Mfg. Co., of Grand Rapids, Mich., was carried at Chatham, Ont. This company will establish a plant, to be in running order by January, 1908. They will give employment to 100 workmen.

Brockville, Ont.—The Brockville Malleable Iron Co., it is stated, is being organized in Brockville with local capital. The directors purpose to establish a plant capable of reducing either 5 tons or 10 tons of castings daily.

Peterboro, Ont.—The Colonial Weaving Co., of Peterboro, it is reported, will erect a new factory 200x60 ft. and install machinery costing $30,000, provided certain conditions are forthcoming from the city. These, it is stated, will likely be granted.

MISCELLANEOUS.

Notes Arranged Alphabetically by States.

**Piggott, Ark.*—Geo. W. Seitz, Secy. Dirs. St. Francis Drainage Dist., of Clay and Green Counties, writes that the contract for constructing ditches (bids opened July 16) has been awarded to A. V. Wills &Sons, of Malden, Mo., at 10.44 cts. per cu. yd. Contract for levee work not yet let.

Arkansas City, Ark.—It is reported that bids will be received Aug. 5 by W. E. Meeks, Co. Clk., for constructing drains and ditches in Drainage Dist. No. 1, approximately 600,000 yds.

New London, Conn.—Bids will be received by Maj. Harry Taylor, Corps Engrs., U. S. A., until Aug. 19 for dredging at mouth of Connecticut River, Conn., as advertised in The Engineering Record.

Washington, D. C.—Bids will be received until July 30 by the Bureau of Supplies and Accounts, Navy Dept., Washington, D. C., for furnishing a quantity of naval supplies at the various navy yards, etc., as follows: Portsmouth, N. H., Schedule 111—Sheet and angle steel. Schedule 116—Electrical wire, key sockets. Boston, Mass., Sch. 107—Bar steel. Sch. 109—Brass bolts, steel bolts and nuts, eyebolts, hose clamps, files, screws, etc. Sch. 111—Phosphor and rolled bronze, sheet copper and iron, silver and wiping solder, bar steel. Sch. 112—Asbestos cement and packing, etc. Sch. 114—Iron pipe, cocks, valves. Newport, R. I., Sch. 101—Sewer pipe and fittings, extending sewer. Sch. 111—Rolled bronze, brass rod, ebonite. New York, N. Y., Sch. 99—Gravel, sand, grit. Sch. 102—Iron doors, ventilators, etc., copper gutter, rails, spikes, etc., steel trusses, cast-iron pipe and specials, hydrants. Sch. 103—Electrical conduit, wire, and supplies, electric light posts, brick, Portland cement, lime, sand, roofing material, lumber, ties. Schedule 105—Boiler, feed pump, windlass. Sch. 106—Air hose, galvanized pipe. Sch. 108—Railroad track, dump cars. Sch. 114—Copper and lead pipe, valves. League Island, Pa., Sch. 102—Purchases, jacks, tools. Sch. 107—Sheet brass and copper, bronze rod, hardware, valves, copper pipe. Washington, D. C., Sch. 99—Electrical cable, curb stone machine, asphalt paving blocks. Sch. 102—Steel balls, steel, grease cups, brass tubing. Sch. 111—Tool steel. Norfolk, Va., Sch. 87—Construction of brick magazine. Sch. 114—Iron pipe. Charleston, S. C., Sch. 104—Motor drive outfits. Sch. 105—Fuel oil forges. Pensacola, Fla., Sch. 96—Creosoted ties. Sch. 97—Electrical supplies, vulcanized rubber, etc. Sch. 98—Steel rivets, bolts and nuts, packing. Mare Island, Cal., and San Francisco, Cal. Sch. 89—Electrical wire. Sch. 90—Corrugated sheet steel. Puget Sound, Wash., Sch. 88—Submarine telegraph cable, Portland cement, fir, c. i. pipe and specials, wrought-iron pipe, valves, hydrants. Sch. 89—Annunciators, searchlight mirror. Sch. 91—Pig and Norway iron, bar steel, steel floor plates. Sch. 92—Hardware, iron chain. Applications for proposals should designate Schedule desired by number. E. B. Rogers, Paymaster-Gen., U. S. N.

Key West, Fla.—Bids will be received until Aug. 14 by Jas. Knox Taylor, Superv. Archt., Washington, D. C., for constructing a new breakwater wall at the U. S. Marine Hospital, Key West.

Savannah, Ga.—Bids will be received by Lieut.-Col. Dan. C. Kingman, Corps Engrs., U. S. A., until Aug. 23 for dredging Skidaway Narrows, Ga., as advertised in The Engineering Record.

Brunswick, Ga.—Bids will be received by Lieut.-Col. Dan. C. Kingman, Corps Engrs., U. S. A., Savannah, until Aug. 22 for dredging in inner and outer harbor at Brunswick, as advertised in The Engineering Record.

Hoopple, Ill.—Bids will be received until Aug. 2 by the Comrs., Drainage Dist. No. 1, Township 18, Range 5 (A. J. Soliday, Chmn.), for the deepening and widening of the main ditch in said drainage district, requiring the removal of about 150,000 cu. yds. materials. F. W. Sears, Engr., Prophetstown.

Richmond, Ind.—See "Sewerage and Sewage Disposal."

Sibley, Ia.—Bids will be received by the Bd. of Superv. of Osceola County until Sept. 10 for the construction of an open ditch requiring about 103,000 cu. yds. excav.,

* *Items marked thus give the names of parties awarded contracts.*

as advertised in The Engineering Record. V. A. Burley, Co. Aud.

Northwood, Ia.—It is stated that bids will be received until Aug. 1 by Iver Iverson, Jr., Co. Aud., for constructing a ditch and tile drain.

Des Moines, Ia.—The City Council on July 17 instructed the Bd. of Pub. Wks. to again ask for bids on the improvement of Raccoon and Des Moines Rivers. Geo. D. Dobson, City Engr.

New Orleans, La.—Bids will be received until Aug. 2 by the Bd. Comrs., Orleans Levee Dist. (T. J. Duggan, Secy.), Rm. 15, Masonic Temple, for constructing a levee and revetment on Dublin St., requiring about 90,000 cu. yds. earthwork and about 77,000 ft. B. M. creosoted pine lumber on 7th St., requiring about 100,000 cu. yds. earthwork; also same place until July 30 for $175,000 Orleans Levee Dist. bonds.

Charles Crawford, Foster Ave. and E. 16th St., *a* 85 cts., *b* $114,750; O'Brien Bros., Inc., 54 South St., *a* 64 cts., *b* $86,400.

Bids will be received until Aug. 7 by Bird S. Coler, Boro. Pres. on the percentage bid system for furnishing material and constructing a crib bulkhead on the 8th Ward Market, bet. 36th and 38th Sts., 2 Ave. and New York Bay. Engineer's preliminary estimate of total cost, $156,934.

New York, N. Y.—The following are the bids opened on July 17 by Col. John G. D. Knight, Corps. Engrs., U. S. A., for dredging in Hudson River, price per cu. yd., scow meas.: The Newburg Dredging Co., Newburg, 24.9 cts.; The International Contracting Co., 17 Battery Pl., 29.8 cts.; Maritime Dredging Co., 78 Broad St., 29.5 cts.; Morris & Cummings Dredging Co., 17 State St., 37 cts.

Bids will be received by the Comrs. of Parks (Moses Herrman, Pres.) for furnishing and delivering 2,000 cu. yds. broken stone of trap rock and 2,000 cu. yds. screenings of trap rock (No. 3, 1907) for parks, Boro. of the Bronx.

Bids will be received until Aug. 6 by J. A. Bensel, Comr. of Docks, for furnishing material and building a new pier at the ft. of James Sl., and for preparing for and building a new bulkhead platform easterly from Boro. Manhattan, as per contract No. 1085. said pier, between James Sl. and Oliver St., East River,

Philadelphia, Pa.—Bids will be received by Maj. J. C. Sanford, Corps Engrs., U. S. A., Philadelphia, until Aug. 12, for dredging in Delaware Bay, at Perrwig Bar, as advertised in The Engineering Record.

A permit has been granted to W. W. Lindsay & Co., Harrison Bldg., to erect for the city a structural steel and reinforced concrete coal elevator 23x34 ft., with a coal pocket and trestle for coal cars and steel coal bins at the Torresdale filtration plant.

Block Island, R. I.—The following are the bids opened on July 17 by Lieut.-Col. J. H. Willard, Corps. Engrs., U. S. A., Newport, for dredging in Block Island (price given per cu. yd.: J. S. Packard Dredging Co., 425 Angell St., Providence, R. I., 40 cts.; Chas. M. Cole, Fall River, Mass., 38 cts., and Maritime Dredging Co., 78 Broad St., New York, N. Y., 39½ cts.

Galveston, Tex.—Bids will be received until Aug. 16 by Capt. John C. Oakes, Corps Engrs., U. S. A., Galveston, for jetty work at mouth of Brazos River, Tex.

**Ft. Morgan, Ala.*—The following are the bds opened on July 12 by Maj. H. Jervey, Corps Engrs., U. S. A., Mobile, for constructing sea wall at Ft. Morgan: (*a*) Chas. Clarke, Galveston, Tex. (recommended for award), (*b*) Christie & Lowe, 171 La Salle St., Chicago, Ill.; (*c*) Walsh-McLellan Contr. Co., Mobile; (*d*) Lane Bros. Co., Esmont, Va.

	*a	b	c	d

**Collinston, La.*—The contract for construction work and digging canal for the Coulee Drainage Dist. is reported to have been awarded to Security Constr. Co., of Royal Center, O., at 12 cents per cu. yd., including the clearing of a 75-ft. right of way.

Ft. St. Philip, La.—The only received by Col. E. H. Ruffner, Corps Engrs., U. S. A., New Orleans, on July 15 for constructing sea wall at Ft. St. Philip was submitted by Christie & Lowe, 107 Camp St., New Orleans, for $105,100.

Lowrence, Mass.—It is reported that bids are wanted by Bellevue Cemetery Dirs. until July 30 for the construction of a concrete receiving vault, reinforced roof, stone entrance, 50x50 estimated cost, $13,000. Wm. Lord, Supt.

Detroit, Mich.—The following are the bids opened on July 3 by Col. Chas. E. L. B. Davis, Corps Engrs., U. S. A., for dredging at Sect. 4, Plan B, Detroit River, about 3,500,000 cu. yds. (*a*), price per cu. yd.; (*b*), total: G. H. Breymann & Bros., Toledo, O., *a*, 25.5 cts.; *b*, $895,500; Arthur H. Vogel, Milwaukee, Wis., *a*, 26.5 cts.; *b*, $927,500; Detroit Dredging Co., Detroit, Mich., *a*, 30 cts.; *b*, $1,050,000; Lake Erie Dredging Co., *a*, 30.5 cts.; *b*, $1,067,500; Buffalo Dredging Co., Buffalo, N. Y., *a*, 32 cts.; *b*, $1,120,000; Great Lakes Dredge & Dock Co., Chicago, Ill., *a*, 35 cts.; *b*, $1,225,000.

Bids were opened same time and place for hire of dredging plant for use in Alpena harbor, and M. Sullivan, of Buffalo, bid for this work $25 per hour.

Fergus Falls, Minn.—The Co. Comrs. are reported to have decided to order the construction of a ditch in Eastern and Effington, and bids will be received early in Aug. About 45,000 cu. yds. earth will be removed; estimated cost, $8,319.

St. Paul, Minn.—An appropriation of $1,600,000 for the improvement of the Missouri River is reported recommended by Capt. E. Schulz, Engr. in charge, in his annual report to Gen. A. MacKenzie. He also asks for $250,000 to maintain improvements between the mouth of river and Sioux City and $100,000 between Sioux City and Ft. Benton.

Kansas City, Mo.—Bids will be received until July 30 by the Bd. Pub. Wks. (Everett Elliott, Secy.) on vacuum cleaning system and 2 direct-connected electric elevators for the general hospital, 24th and Locust Sts.

Ft. Omaha, Neb.—Bids will be received until Aug. 8 by Maj. Thos. Cruse, Q. M., Army Bldg., Omaha, for constructing a balloon house, a hydrogen gas house and wireless telegraph station at Ft. Omaha.

Portsmouth, N. H.—Bids will be received until Aug. 10 by R. C. Hollyday, Ch. Bureau of Yards and Docks, Navy Dept., Washington, D. C., for filling in back of quay wall, navy yard, Portsmouth, as per specification No. 1550. Est. cost, $42,000.

Albany, N. Y.—F. C. Stevens, State Supt. Pub. Wks., writes that no bids were received on July 18 for arch culvert or aqueduct at Durhamville, near the city of Oneida.

Governors Island, N. Y. H., N. Y.—Bids will be received by Lieut.-Col. W. L. Marshall, Corps Engr., U. S. A., N. Y. City, until Aug. 26, for furnishing material and building an embankment at Governors Island, N. Y. H., as advertised in The Engineering Record.

Cincinnati, O.—The Park Comn. is reported to have formally asked the Bd. of Pub. Service to petition Council for $100,000 for the construction of a parkway between Burnett Woods and Eden Park.

The following are reported to be the bids opened on July 18 by Lieut.-Col. T. Rossell, Corps Engrs., U. S. A., for constructing dam of concrete, etc., at head of Brown's Island, Ohio River: P. C. Tennur, Louisa, Ky., $55,006, and J. C. Thomas, of Bellaire, O., $74,614.

**Cleveland, O.*—The Buckeye Constr. Co., of Cleveland, has secured contracts for repair of jetties as follows (bids opened June 20 by Lieut.-Col. C. McD. Townsend), Port Clinton harbor, 1,800 tons heavy rip rap stone, $1.85, and 200 tons small rip rap stone, $1.65, and in Vermillion harbor 2,500 tons paving stone, $2.80; 3,500 tons heavy rip rap stone, $1.80; 300 tons small rip rap stone, $1, and 650 lin. ft. preparing old jetties, $3.

*The following are the bids opened on July 5 by Lieut.-Col. C. McD. Townscend, Corps. Engrs., U. S. A., for 800,000 cu. yds. dredging in Cleveland harbor (price given per cu. yd.): Daly & Hannan Dredging Co., Ogdensburg, N. Y., 17.5 cts.; G. H. Breymann & Bros., Toledo, 22 cts.; Great Lakes Dredge & Dock Co., Chicago, Ill., 13.95 cts. (awarded contract); Graves & Stephens, Cleveland, O., 15.5 cts., and Great Lakes Dredging Co., Buffalo, N. Y., 22 cts.

Panama.—Bids will be received until Aug. 2 by D. W. Ross, Genl. Purchasing Officer, Isthmian Canal Comn., Washington, D. C., for furnishing dump cars.

Bids will be received until Aug. 12 by D. W. Ross, Genl. Purchasing Officer, Isthmian Canal Comn., Washington, D. C., for furnishing 3 steel dump cars, as per circular No. 380.

Harrisburg, Pa.—Gov. Stuart is reported to have approved the application of the Pure Oil Pipe Line Co., in which ex-Senator Lewis Emery, Jr., is said to be interested for a new pipe line through the southern tier of counties. According to the survey the line is to start in Henry Clay Township, Fayette County, and to end at Marcus Hook, on the Delaware River, traversing Fayette, Somerset, Bedford, Fulton, Franklin, Adams, York, Lancaster, Chester and Delaware Counties. The application was made at Philadelphia by Michael Murphy, Pres.

Norfolk, Va.—The following are the bids opened on June 29 by Maj. Jos. E. Kuhn, Corps Engrs., U. S. A., for dredging harbor at Norfolk, about 7,600,000 cu. yds. (price given per cu. yd.): American Dreding Co., Philadelphia, Pa., 7.45 cts.; Maryland Dredging & Contr. Co., Baltimore, Md., 7.5 cts.; P. Sanford Ross, Inc., Jersey City, N. J., 12.24 cts.; Norfolk Dredging Co., Norfolk, Va., 11.75 cts.; Morris & Cummings Dredging Co, New York, N. Y., 9 cts.; Coastwise Dredging Co., Norfolk, Va., 7.3 cts. (lowest bidder), and Standard Dredging Co., Wilmington, Del., 8.2 cts.

*The Bd. of Control is reported to have awarded contract to the Trussed Concrete Steel Co., 403 Wilson Bld., Baltimore, Md., for the trussed steel bars to be used in improving Little Creek dam, for which $18,000 has been appropriated.

Seattle, Wash.—The following the the bids opened on July 12 by Maj. H. M. Chittenden, Corps. Engrs., U. S. A., for dredging (*a*) Grays Harbor, 12,000,000 cu. yds.; (*b*) Wellapa River, 84,000 cu. yds. (price given per cu. yd.): Puget Sound Bridge & Dredging Co., Seattle, *a* 16.9 cts., *b* 26.9 cts.; Richmond Dredging Co., San Francisco, Cal., *a* 18.75 cts., *b* 31 cts.; North American Dredging Co., San Francisco, Cal., *a* 15.5 cts., *b* 26 cts.; International Contract Co., Seattle, *a* 19.3 cts., *b* 2 .27 cts.

Bremerton, Wash.—Bids will be received at the Bureau of Yards and Docks, Navy Dept., Washington, D. C., until Aug. 24 for constructing a concrete quay wall at the Puget Sound Navy Yard, Bremerton, Wash., as per Specification No. 1551.

Ashland, Wis.—Press reports state that the Chicago & Northwestern Ry. Co. (E. C. Carter, Ch. Eng., Chicago, Ill.) will construct an ore dock in Ashland this winter to cost about $500,000.

Peterboro, Ont.—Bids will be received until Aug. 7 by Alex. J. Grant, Supt. Engr., Trent Canal, Peterboro, for the works connected with the construction of Sec. 5, Ontario-Rice Lake Div. of the canal.

**Irvine, Ky.*—Bids were opened on June 4 by Maj. J. G. Warren, Corps Engrs., U. S. A., Cincinnati, O., for constructing Lock and Dam 12, Kentucky River, near Irvine, Ky. Figures were submitted on two plans, and the following are the totals of bids on both plans, also the detail bids on Plan 1: (*a*) Sheridan-Kirk Contract Co., Cincinnati, O., Plan 1, $406,393; Plan 2, $447,429. (*b*) The Hollerbach & May Contract Co., Evansville, Ind., Plan 1, $412,352; Plan 2, $451,112. (*c*) Mason, Hanger & Coleman Co., Richmond, Ky., Plan 1, $496,780; Plan 2, $545,875. (*d*) H. E. Talbott & Co., Dayton, O., Plan 1, $395,669; Plan 2, $434,329. (*e*) Bates & Rogers Construction Co., Chicago, Ill., Plan 1, $514,222; Plan 2, $563,347. (*f*) Ohio River Contract Co., Evansville, Ind., Plan 1, $381,309 (awarded contract); Plan 2, $417,469.

Plan 1—	a	b	c	d	e	*f

American Society for Testing Materials. Secretary, Prof. Edgar Marburg, University of Pennsylvania, Philadelphia, Pa.

American Society of Municipal Improvements. Secretary, George W. Tillson, Room 12, Municipal Building, Brooklyn, N. Y.

Association of Railway Superintendents of Bridges and Buildings. Secretary, S. F. Patterson, Concord, N. H.

American Railway Engineering and Maintenance of Way Association. Secretary, E. H. Fritch, 962 Monadnock Block, Chicago.

American Water Works Association. Secretary, J. M. Diven, Charleston, S. C.

American Street and Interurban Railway Association. Secretary, Bernard V. Swenson, 29 West 39th St., New York.

American Foundrymen's Association. Secretary, Richard Moldenke, P. O. Box 432, New York.

Engine Builders' Association of the United States. Secretary, J. L. Lyle, 39 Cortlandt St., New York.

American Public Works Association. Secretary, W. H. Flint, Chattanooga.

Association of American Portland Cement Manufacturers. President, J. B. Lober, 1232 Land Title Building, Philadelphia.

National Association of Cement Users. President, Richard L. Humphrey, Harrison Building, Philadelphia.

American Society of Refrigerating Engineers. Secretary, H. W. Ross, Room 806, 258 Broadway, New York.

American Public Health Association. Secretary, Dr. C. O. Probst, Columbus, O.

A REMOVABLE LOCK FOR STEEL SHEET PILING.

A removable lock for steel sheet piling has been patented recently by Mr. Geo. E. Nye, of the National Interlocking Steel Sheeting Co., Chicago. Standard structural-steel channels or I-beams are used with the lock, two types of which are employed, one for the botom end and one for the top. The locks are all made of cast-steel and are applied and detached without requiring bolts, rivets or fabrication of any kind. Those for the top ends of the piling each consist essentially of a heavy yoke or cap that fits snugly over the top of the web of the channel and carries a lug at each end, which is shaped to fit closely against the outer side of the adjacent webs of the adjoining member and against the back face of the latter. These locks are placed with the lugs alternately on one side and then on the other of the row of sheeting, the alternate members being driven with their flanges in one direction, and the other members with their flanges in the opposite direction. The yoke of each lock forms a driving cap for the members to which it is attached by a driving fit over the web of the latter.

The locks for the lower ends of each member are very similar to those for the tops, except that the yoke of these bottom locks is made with a pointed edge; the lugs on them are also beveled for the same purpose. The bottom locks are also placed alternately on one side and then the other of the row of piling, and are made with one or two lugs, as is desired.

The wall formed by channels or I-beams with these locks is particularly rigid and is considered to be especially adapted to any work in which an unyielding retaining wall is required. At the same time, a large reduction in weight, as compared with other forms of steel piling, is made possible, and the cost is materially reduced by the opportunity afforded to use standard steel sections, without any fabrication whatever. The two locks to each channel weigh 15 lb. apiece for 15-in. standard 33-lb. channels, and when driven weigh 29⅓ lb. per square foot.

The proposals recently received by the United States Government for the construction of a concrete wall over 4,300 ft. in length, for bank protection at Fort St. Philip, La., near the mouth of the Mississippi River, are considered to illustrate the saving that is made possible by this new form of piling. A concrete wall is to be built over the top of a continuous row of steel sheet piling driven to a depth of about 19 ft. and extending well up into the body of the wall. The proposal made by Messrs. Christie & Lowe to use the Nye piling was about $6,000 below any other proposal made by these contractors, who submitted the only bids, using other forms of piling. The Nye piling in this work requires 1,200 tons, as compared with the next lowest section of 1,320 tons, and the highest of 1,430 tons and drives in widths 13½ in. effecting a considerable saving in the cost of driving, as fewer pieces are required.

TOP AND BOTTOM LOCKS ON PILING.

BOTTOM AND TOP OF BOTTOM LOCK.

PERSONAL NOTES.

Mr. I. Austin Miller has resigned as city engineer of Houston, Tex.

Mr. W. T. Scudder has resigned as assistant city engineer of Galveston, Tex.

Mr. J. E. Foote has been appointed assistant city engineer of Little Falls, N. Y.

P. H. Glatfelter, president of the York Mfg. Co., York, Pa., died July 11, at Spring Forge, Pa.

Mr. P. E. Fletcher has been appointed resident engineer in the service of the Illinois State Geological Survey.

Mr. V. E. Ohl has resigned as chief engineer of the Tennessee Coal, Iron & Railroad Co. to become city engineer of Ensley, Ala.

Mr. Tsenyoshi Ohtale, architectural engineer of the South Manchurian Railway Co., is in this country inspecting railway buildings.

Mr. H. A. Raider has been promoted from inspector to assistant engineer in the service of the Baltimore Sewerage Commission.

Mr. R. C. H. Davidson, of London, Eng., has been retained by the Harbor Commissioners of Montreal, Canada, to investigate the development of the harbor of that city.

Mr. G. M. Hall, an irrigation engineer in the service of the United States Department of the Interior, has been sent to Porto Rico to prepare plans for the irrigation of large sugar-growing districts.

Mr. A. C. Brower has been appointed division engineer of the Wichita division of the Missouri Pacific Ry. System, succeeding Mr. E. C. Welch, who has been transferred to a similar position at De Soto, Mo.

Mr. H. M. Hensen, supervisor of bridges and buildings of the Denver, Kansas & Gulf R. R., has accepted a similar appointment with the Colorado Southern, New Orleans & Pacific R. R., at Beaumont, Tex.

Mr. Marshall B. Palmer, resident engineer of the New York State Barge Canal Water Supply Department, at Rome, N. Y., has resigned to take charge of surveys for a high service reservoir and conduit line for Syracuse, N. Y., under the direction of Mr. H. C. Allen, city engineer.

Mr. Benjamin Talbot, formerly steel manager at the Pencoyd Iron Works, has been appointed managing director of the Cargo Fleet Iron & Steel Co., one of the largest concerns of the sort in Great Britain.

Mr. Lewis N. Wilson has resigned as assistant city engineer of Knoxville, Tenn., to become city engineer of Johnson City, Tenn.

Mr. William D. Marks, consulting engineer and statistician, has removed his offices to 623-624 Park Row Building, New York City.

Mr. Morris R. Sherrerd, city engineer of Newark, N. J., has been appointed engineer of the New Jersey State Potable Water Commission.

Mr. E. L. B. Gardiner, of Paterson, N. J., has been elected president of the Consolidated Water Co., Utica, N. Y., succeeding Mr. J. V. Cockroft, retired.

Mr. L. A. Waterbury, instructor in civil engineering at the University of Illinois, has been appointed professor of civil engineering at the University of Arizona.

Mr. Calvin W. Hendrick, chief engineer of the Baltimore Sewerage Commission, sailed from New York for Paris, France, Aug. 1. He will make a tour of inspection of European cities, studying their sewerage works.

Joseph W. Zipperlein, vice-president of the Wm. G. Hartranft Cement Co., Philadelphia, Pa., and an associate of the American Society of Civil Engineers, died, July 22, at his home in Ashbourne, Pa., aged 37 years.

Mr. Mason D. Pratt has been appointed chief engineer of the Washington & Berkeley Bridge Co., Williamsport, Md., and is preparing plans for a 1,500 ft. reinforced concrete bridge over the Potomac River at Williamsport.

A party of eighteen Danish engineers, architects and journalists recently reached New York City and will spend about five weeks in this country studying important engineering works and social conditions in the large cities.

T. F. Osborn, engineer for Mr. Carl Leonardt, contractor, Los Angeles, Cal., died July 20. He was a specialist in reinforced concrete, and at the time of his death was in charge of construction for Mr. Leonardt of a number of large buildings.

The Appalachian Engineering Association will hold its summer meeting at Newport News, Va., Sept. 7, at the Hotel Warwick. Engineers visiting the Jamestown Exposition and those who have the opportunity to attend the sessions of the Association are cordially invited to be present.

Samuel McClintock Hamill, formerly manager of the Brush Electric Co. and vice-president of the Sprague Electric Co., and later associated with the General Electric Co. after the Brush Electric Co. was merged with that concern, died at his home in Schenectady, N. Y., July 29, aged 49 years.

Mr. W. B. Cansey, engineer of maintenance of way of the Chicago & Alton R. R., at Bloomington, Ill., has become superintendent of the Eastern division of the Chicago & Alton, with headquarters in the same city, succeeding Mr. W. L. Derr, who recently resigned to become superintendent of the New York City street railway lines.

The United States Navy Department will hold an examination at the Federal Building, Chicago, Ill., Aug. 16, to establish an eligble register of subinspectors of building construction work at the U. S. Naval Training Station, North Chicago, Ill. For further information address Mr. Truman H. Newberry, Acting Secretary, Navy Department.

Messrs. Carrol Paul, Annapolis, Md.; G. S. Burrell, Mount Vernon, O.; Ralph Whitman, Washington, D. C.; Carl Bostrom, Washington, D. C.; R. M. Warfield, New York, N. Y., and W. C. Furer, Key West, Fla., have been commissioned as assistant civil engineers in the United States Navy Department with the rank of lieutenant, junior grade.

Capt. Edwin R. Stuart, Corps of Engineers, U. S. A., on duty at the Infantry and Cavalry School and Staff College as assistant instructor of engineering, has been detailed to serve also as engineer of the Sixth Lighthouse District, relieving Capt. George P. Howell, who was recently ordered to the Philippine Islands in connection with the construction of fortifications.

Mr. Frederick Skene, State Engineer and Surveyor of New York, recently appointed, as assistant engineers in his department, Messrs. G. H. Haley, W. H. Slingerland, F. C. Woodward, Max Wolff, A. C. Richards, H. C. Olcott, G. R. Halpin, O. M. Severson, G. H. Thomson, W. G. Harger, J. S. Summers, Hall Gleason, F. F. Miller, A. G. Austin, H. W. Benedict, G. A. Ensign, C. L. Crowley, H. S. Blake.

Dr. David T. Day, chief of the Bureau of Mining and Mineral Resources, United States Geological Survey, will be succeeded Aug. 1 by Mr. Edward W. Parker, coal expert in the service of the Geological Survey. The change is to be made at the request of Dr. Day, who will devote his attention to studies of petroleum, continuing in the service of the Survey at his present salary.

Messrs. Robt. S. Peabody, of Boston; Desmond Fitz Gerald, of Brookline; Henry B. Day, of Newton; Thomas J. Gargan, of Boston, and Benjamin N. Johnson, of Lynn, representing architecture, engineering, finance, transportation and law, respectively, have been named as the Metropolitan Improvement Commission recently authorized by the Massachusetts legislature.

Mr. Bion J. Arnold, chief engineer of the board of supervising engineers of the Chicago traction interests; Mr. George W. Weston, assistant chief engineer of the board, and Mr. Harold B. Fleming, representing the Chicago City Railway Company, recently made a tour of inspection in the East, visiting steel mills, car shops and subway and tunnel construction at Philadelphia and New York.

Candidates for several vacancies in the grade of hydrographic surveyor in the Navy Department will be examined by the U. S. Civil Service Commission on Sept. 4 and 5. The work will be done on the south coast of Cuba and is expected to last several years. Applicants must have had five years' surveying experience, of which at least two years was in charge of a party or as transitman. A degree in civil engineering is considered equal to three years' experience.

The New York State Civil Service Commission will hold examinations, Aug. 24, of candidates for positions as assistant civil engineer, bridge designer, bridge draftsman and civil engineering draftsman. The Commission has been unable to secure sufficient eligibles for these positions, and qualified applicants have excellent chances of appointment. The last day for filing applications is Aug. 17. Address Charles S. Fowler, chief examiner, Albany, N. Y.

The following first lieutenants of the Corps of Engineers, U. S. A., have been transferred as indicated: William P. Stokey, from the Military Academy to Havana, Cuba, for duty with the 2d Battalion of Engineers; Henry C. Jewett, to the Military Academy; William D. A. Anderson and Thomas M. Robins, from the Engineer School, Washington Barracks, to Havana, Cuba, for duty with the 2d Battalion of Engineers; Ralph T. Ward, from the Engineer School to Fort Mason, for duty with the 1st Battalion of Engineers.

Mr. H. C. Hale, for many years mechanical engineer and designer with the Webster, Camp & Lane Co. and later manager of the Mineral Ridge Mfg. Co., and Mr. F. B. Duncan, for several years general superintendent of engineering and manufacturing for the Northern Electrical Mfg. Co. and later manager of the Akron Electrical Mfg. Co., have formed a partnership under the name of Hale & Duncan, with offices in the Schofield Bldg., Cleveland. They will act as designing and contracting engineers, making a specialty of electric equipment for mines.

Mr. Joseph W. Hunter, State Highway Commssioner of Pennsylvania, has announced the following appointments, made in accordance with the act recently passed by the legislature reorganizing the highway department: As deputy commissioner, R. D. Beman, Meadville; assistant commissioner, G. W. Ensign, Warren; engineers, C. F. Hamilton, Franklin; F. F. Hallam, McKeesport; C. W. Bosley, Hollidaysburg; E. D. Garrett, Downingtown; G. H. Biles, Philadelphia; J. R. Wilson, Washington; J. T. Gephart, Lancaster; C. W. Hardt, Camp Hill; A. W. Long, Scranton; S. W. Jackson, Meadville; W. A. Wynn, Pittsburg; chief draftsman, C. E. Douglass, New Castle.

Brig.-Gen. Charles Francis Powell, U. S. A., retired, died in St. Paul, Minn., July 30, aged 63 years. He was born in Jacksonville, Ill., and received his early education in the public schools of Milwaukee, Wis. At the breaking out of the Civil War he enlisted in the 5th Wisconsin Volunteers, and rose to be sergeant major of his regiment. In September, 1863, his gallantry on the field of battle won for him from President Lincoln an appointment to West Point. He was graduated in 1867, and was assigned to the Corps of Engineers. During his service he was engineer in charge of the Cascades Canal, of the Columbia River, secretary of the Mississippi River Commission, engineer in charge of the Missouri River survey and improvement, engineer commissioner of the District of Columbia and engineer of the defences of Long Island. He rose to the rank of colonel, and was retired from active service in March, 1906, with the rank of brigadier-general.

William Hamilton Russell, of the New York architectural firm of Clinton & Russell, died recently in Cannes, France, aged 51 years. He graduated from Columbia University in 1878 and soon after entered the office of his great uncle, Mr. James Renwick, the architect of St. Patrick's Cathedral, and was soon admitted to partnership in the firm, which was known as Renwick, Aspinwall & Russell. Later Mr. Russell became associated with Mr. Charles W. Clinton, under the firm name of Clinton & Russell. Mr. Clinton was one of the pioneers in the designing of lofty office buildings, and after Mr. Russell joined him they planned and constructed many of the most notable examples of this style of architecture in New York. Among them are the Atlantic Mutual, Mutual Life, American Exchange National Bank, Broad Exchange, Tontine, Broadway and Consolidated Exchange buildings.

A catalogue of interest to makers of concrete blocks has just been issued by the Pettyjohn Co., Terre Haute, Ind. This company's molding machines and appliances for dry mixtures are well known, but the new Invincible machine is a novelty which will attract special attention because it can be used with wet mixtures. It is made in many sizes, that most generally useful being able to turn out a block 40 in. long or any number of blocks 4 in. or more in size, and having a total length not exceeding 40 in. In view of the marked preference for wet mixtures shown by many architects, the full description of this machine given in the catalogue is decidedly timely. It contains equally thorough descriptions of the other apparatus made by the company, and a large amount of information regarding the selection and manipulation of materials for concrete blocks.

CONTRACTING NEWS

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS, ENGINEERS AND MANUFACTURERS

ENGINEERING AND BUILDING SUPPLIES

WATER.

Notes Arranged Alphabetically by States.

Phoenix, Ariz.—Local press reports state that work will probably soon commence on the enlargement of the water system at a cost of $150,000.

Redding, Cal.—See "Power Plants, Gas and Electricity."

**Los Angeles, Cal.*—The Bd. of Pub. Works has let contract to the J. D. Hooker Co., of Los Angeles, for 13,000 ft. -in. No. 12 gage riveted sheet steel pipe at 22 cts. per ft., and 5,000 ft. 8-in. No. 14 gage riveted sheet steel pipe at 33 cts. per ft. The pipe is to be used for hydraulic sluicing in the construction of one of the large reservoirs of the $24,000,000 water system that the city is building.

Canon City, Colo.—The City Engr. is reported to have commenced surveying for a water conduit from Cottonwood Creek at Coaldale to Canon City. It is stated that bids will be called for at completion of survey; probable cost, $400,000.

Commerce, Ga. T. A. Little, City Clk., writes that bonds to the amount of $45,000 will be issued for water works and sewers. Engineer not yet selected. C. J. Hood, Mayor.

Juliaetta, Idaho.—The question of constructing water works is reported under consideration here.

Cottonwood, Idaho.—Saml. Goldstone is reported interested in the construction of a pumping plant here.

Springfield, Ill. Maj. L. W. Southwick, Supt. Water Wks., is reported to have recommended the construction of a dam for the improvement of the water supply.

**Mattoon, Ill.*—J. L. Bennett, Secy. Mattoon Water Works & Reservoir Co., writes that the contract for constructing trench and laying approximately 2 miles of c. i. pipe, 12-in., was awarded on July 24th to Gohring & Dunkel, of Tuscola, at 33 cts. per ft., and the contract for 3 miles of vitr. pipe sewers, mostly 18-in., to W. Ed. Millar, Charleston, Ill., at 35½ cts. per ft., for 15-in., 32 cts., and 12-in., 21 cts., and $23 each for manholes.

Chicago, Ill.—Bids will be received until Aug. 7 by the Bd. Local Improv. (H. S. Dietrich, Pres.), for constructing water supply and water service pipes in portions of numerous streets.

Lombard, Ill.—Bids will be received until Aug. 19 by the Village Bd. (H. L. Whitely, Clk.), for furnishing and erecting an elevated steel tank of 60,000 gals. capacity upon a steel tower. W. S. Shields, Engr., 1201 Hartford Bldg., Chicago.

Scottsburg, Ind.—See "Power Plants, Gas and Electricity."

Terre Haute, Ind.—See "Public Buildings."

Grinnell, Ia.—See "Sewerage and Sewage Disposal."

Des Moines, Ia.—The Des Moines Water Works Co. is reported to have decided to expend about $500,000 in improvements.

Almena, Kan.—Bonds recently voted for water works have been found illegal and a new election will be called. Estimates of cost of the new plant are being prepared by Burns & McDonnell, Engrs., Dwight Bldg., Kansas City, Mo.

Independence, Kan.—J. D. Kramer, City Clk., writes that the citizens on July 24 voted to issue $50,000 bonds for extending and enlarging the water works.

Louisville, Ky.—Bids will be received until Aug. 12 by W. G. Dearing, Custodian, for a deep well and pumping apparatus in the U. S. Postoffice and Court House.

**London, Ky.*—The London Water Works Co. is reported to have awarded to Alex. T. Wilson, of Barbourville, the contract to drill wells in East London to supply a system of water works for the entire town.

Carlisle, Ky.—The city is reported to be considering the construction of water works.

**Eunice, La.*—The City Council is reported to have on July 18 awarded contract for water works to P. H. Porter, of Clinton, Ky., for $26,996.

**Carencro, La.* The contract for constructing water works is reported to have been awarded to P. H. Porter, of Clinton, Ky., for about $12,500.

Franklinton, La.—The Police Jury is reported to be considering the sinking of an artesian well in the public square.

**Comfrey, Minn.*—Oscar Erickson, Pres. of Council, writes that the contract for constructing water works (bids opened July 16) has been awarded to Des Moines Bridge & Iron Works, of Des Moines, Ia., for $7,600.

**Moorhead, Minn.*—Jas. Kennedy, of Fargo, N. D., is reported to have secured the contract for furnishing material and laying a water main on Front St. (bids opened July 22), for $5,437.

Jackson, Miss. It is stated that bids will be received until Aug. 6 by Ramsey Wharton, Mayor and the Bd. of Aldermen for $216,000 water bonds.

Exeter, Neb. Plans and specifications are being prepared for new water works at Exeter, to cost $15,000. Bids will be received at an early date for a deep well. Burns & McDonnell, Engrs., Dwight Bldg., Kansas City, Mo.

Falls City, Neb.—See "Power Plants, Gas and Electricity."

Reno, Nev.—See "Power Plants, Gas and Electricity."

**Atlantic City, N. J.*—The Water Dept. is reported to have awarded to the Bethlehem Steel Co., of South Bethlehem, Pa., the contract for a 12,000,000 gal. pump to be installed at the plant at Absecon, for about $45,000.

**Trenton, N. J.* The Water Works Comrs. are re-

** Items marked thus give the names of parties awarded contracts.*

ported to have awarded contracts as follows: To S. W. Mather & Son, of Trenton, for pump house $5,383; Wm. R. Thropp for stand pipe, $12,122, and the Platt Iron Wks. of Ohio for pumping plant, $12,500.

Aztec, N. M.—It is reported that bids will be received until Aug. 10 by the Citizens' Ditch & Irrigating Co., at Aztec, for constructing an irrigation canal 26 miles

Springer, N. M.—The Palo Blanco Land & Irrigation Co. is reported incorporated with a capital of $175,000 for irrigation purposes. Incorporators: Chas. E. Hartley, Chris. Hansen and Chas. F. Hortenstein, all of Springer.

Hagerman, N. M.—O. R. Tanner, Town Clk., writes that the citizens on July 20 voted to issue $4,000 bonds for the construction of water works.

Syracuse, N. Y.—Henry C. Allen, City Engr., is reported to have selected M. B. Palmer, of Rome, to survey site for new high service distributing reservoir and the second conduit line to Skaneateles Lake.

New York, N. Y.—Bids will be received until Aug. 14 by John H. O'Brien, Comr. Water Supply, Gas and Electricity, New York City, for furnishing and delivering repair and renewal supplies for pumping stations in Boroughs of Manhattan and Bronx, including the following: Extra heavy valves, extra heavy cocks, blacksmiths', machinists', carpenters' and measuring tools, hardware, sheet metal, etc., w. i. pipe, boiler gauge glasses, oil cups, lubricators, grease cups and parts and gauge cock pencils, ground fire brick, cement, etc.; also same date and place for furnishing and delivering repair and renewal supplies for pumping stations in Boro. of Queens, as follows: Valves and cocks, w. i. pipe, pipe fittings and brass unions, tools, hardware and files, boiler gauge glasses, pressure gauges, lubricators, etc., lime, cement, lumber, etc.

**Irvington, N. Y.*—Jas. G. Orten, Clk. Bd. Water Comrs., writes that the contract for laying about 3,000 ft. 12-in. c. i. water pipe (bids opened July 23) has been awarded to Thos. O'Hearn, 335 So. Bway., Yonkers, for $7,400.

Shelby, N. C.—Bids are wanted until Sept. 2 for $100,000 water works and sewerage bonds. For full particulars address Reyburn & Hoey, city attys., Shelby.

Carrington, N. D.—Bids will be received by the City Council until Sept. 2 for the construction of a steel standpipe and foundation for a water works system, as advertised in The Engineering Record.

**Cincinnati, O.*—Aug. Silk is reported to have secured the contract for laying water mains on Glenway, Purcell, Woodlawn and other avenues and streets, for about $9,500.

Bids will be received until Aug. 27 by the Bd. Trus. Comrs. Water Works (Aug. Herrmann, Pres.), for laying about 2,600 lin. ft. 12 and 8-in. c. i. pipe on Grand, Warsaw and Price Aves.; also same time and place for constructing narrow gauge coal and ash handling tracks, and for laying an 8-in. filtered water pipe at the River Pumping Station, and for grading, sodding and constructing driveways, walks and other work in connection therewith, and the delivery of track material at the Main Pumping Station.

Cleveland, O.—The Council on July 23 passed ordinances appropriating for the Water Dept. $80,000 for meters, $2,000 for lead pipe, $10,000 for pig lead, $10,000 for valves, $10,000 for fittings, $15,000 for hydrants and $6,000 for stop cock boxes.

Bids will be received until Aug. 8 by the Bd. Pub. Service (A. R. Callow, Secy.), for furnishing and delivering to the Water Wks. Div., Bd. Pub. Service, 5,000 5/8-in. water meters, with the privilege of 10,000.

Hamilton, O.—Bids will be received by the Bd. of Pub. Service (S. M. Goodman, Chmn.), until Aug. 13 for sand pumping driven wells, placing stop valves in branch pipes of driven wells, driving driven wells, pumping pit and house for centrifugal pumps, two 4,000,000 gal. duty centrifugal or turbine pumps to work against 70 ft. head and water connections, two 100 h.-p. alternating current electric motors and starting devices, 1,000 ft. electric pole line, and furnishing and laying 24-in. discharge pipe, etc., as advertised in The Engineering Record. Engineer, John W. Hill, 506 First Natl. Bank Bldg., Cincinnati.

Harrison, O.—See "Power Plants, Gas and Electricity."

Ashland, O.—Bids will be received until Aug. 12 at the office of A. P. Black, Village Clk., for $45,000 bonds, to be issued for the purpose of repairing, enlarging, replacing and extending the water works pumping station, pumps, engines, boilers and pipe lines of the water works system.

Bids will be received until Aug. 26 by the Bd. Trus. Pub. Affairs for furnishing and installing a water pumping plant at the pumping station to consist of a high duty horizontal cross compound condensing crank and flywheel steam pumping engine, capacity 1,500,000 U. S. gals. per day of 24 hours, and 2 125 h.-p. each internal furace boilers, together with boilers, engines, feed pumps and all apparatus necessary to operate the pumps, and boliers. Plans are on file at the office of A. P. Black, Village Clk.

Pawhuska, Okla.—C. T. Bennett, City Clk., writes that the City Council will consider private lump sum bids for water works and a sewerage system. All bids recently received have been rejected.

Reading, Pa.—The Special Com. on Filtration at a meeting of Council July 29 presented a report recommending a loan of $500,000 to the filtration system to include the entire city water supply.

**Tarentum, Pa.*—The Roberts Mfg. Co., Philadelphia, is reported to have secured the contract for constructing a filtration plant for the Tarentum Water Co., in Brackenridge; cost about $50,000.

Panama.—See "Miscellaneous."

Bonesteel, S. D.—Bids will be received until Aug. 8 by M. P. Dowling, Town Clk. for constructing water works.

Denison, Tex.—This city is reported to have voted to issue $125,000 bonds for the construction or purchase of water works.

**Salt Lake City, Utah*—Thos. C. Callister, Secy. State Ed. Land Comrs., writes that the contract for constructing a reservoir dam and a canal on the Sevier River near Hatch Town, has been awarded to B. Brinton, of Brinton, for $65,936.

**Burlington, Vt.*—J. W. Goodell, Secy. Water Com., writes that the Ley Constr. Co., 29 Bway., New York, N. Y., has secured the contract for constructing filter plant, with electrically operated centrifugal pupmps (bids opened July 22) at a total of $36,729. It bid for 450 cu. yds. earth excav., 60 cts.; 3 m. ft. sheet piling, $75; 500 lin. ft. round piles, 40 cts.; 825 cu. yds. concrete, $9.80; 65,000 lbs. steel rods, 5 cts.; for filter house with appurtenances, lump sum, $6,750; pipes, specials, gates, meter, etc., lump sum, $6,600; loss of head gages, etc., lump sum, $2,650; piping and gutters in filter tank, lump sum, $1,400; filter gravel, lump sum, $235; filter sand, lump sum, $544; coagulating device, complete, lump sum, $1,350; embankment, lump sum, $280; electrically operated contrifugal pumps, lump sum, $4,800. It also bid with steam operated centrifugal pumps, $37,109. Totals of other bids received: (*a*) with steam operated centrifugal pumps, (*b*) electrically operated centrifugal pumps. Union Filter Co., Pittsburg, Pa., *a* $42,771, *b* 43,471; The N. Y. Continental Jewell Filtration Co., 15 Broad St., New York, N. Y., *a* $40,189, *b* $39,869.00; Thre Greer Filter Co., Pittsburg, Pa., *a* $38,429, *b* $38,029; Norwood Eng. Co., Florence, Mass., *a* $40,272, *b* $38,772. Engineers, Hering & Fuller, 170 B'way, New York, N. Y.

Toppenish, Wash.—R. D. Campbell, Town Clk., writes that an election will be held in Aug. to vote on constructing water works, to cost between $10,000 and $14,000. Engineer, W. J. Roberts, of Pullman.

**Viola, Wis.*—The National Constr. Co., of South Bend, Ind., is reported to have secured the contract for constructing water works at Viola.

Cheyenne, Wyo.—The City Council has instructed C. C. Carlisle, City Engr., to prepare plans for remodeling the city water works, the work to include construction of masonry dam 75 ft high, to form storage reservoir, to cost about $40,000; also laying over a mile of c. i. water pipe.

Windsor, Ont.—Bids will be received until Aug. 8 by Stephen Lusted, City Clk., for $10,000 water works bonds.

Halifax, N. S.—Bids will be received until Aug. 13 by the Mayor for supplying 2,900 1/2-in. and 100 3/4-in. water meters. J. J. Hopewell, Clk. of Works.

SEWERAGE AND SEWAGE DISPOSAL.

Notes Arranged Alphabetically by States.

**Ensley, Ala.*—The Southern Bitulithic Co., of Nashville, Tenn., is reported to have on July 18 secured the contract for constructing a storm sewer at Ensley for $18,000.

Paragould, Ark.—The question of constructing a sewerage system here is being discussed.

Fayetteville, Ark.—Bids will be received until Aug. 22 by the Bd. Improv., Sewer Dist. No. 1 (I. G. Combs, Chrmn.) for furnishing material and constructing a system of sewers. Burns & McDonnell, Engrs., 709 Dwight Bldg., Kansas City, Mo.

Oakland, Cal.—Bids will be received until Aug. 14 by the Bd. Pub. Wks. (Walter B. Fawcett, Secy.), for furnishing material and constructing a concrete and ironstone pipe storm sewer in Canning St.

Alamosa, Colo.—It is reported that a sewerage system will be constructed here at a cost of $25,000.

Denver, Colo.—Bids will be received until Aug. 7 at Rm. 31, Clayton Blk. Denver, for furnishing material and constructing the Clayton College pipe line comprising about 4 miles of vitrified clay pipe and steel pipe with manholes and other appurteances according to plans in the office of Peter O'Brien, Civil Engr., Nassau Blk., Denver. Moses Hallett, Trus., estate of Geo. W. Clayton.

**Lamar, Colo.*—C. W. Heaton, City Clk., writes that the following are the bids opened on July 15 for the construction of a sewerage system: P. O'Brien, Denver, Colo., $87,425; National Constr. Co., Denver, Colo., $76,510; T. J. Sayler & Co., Lamar, $76,200, and Gibbons S .Hughes, Denver, Colo., $75,124 (awarded contract).

Commerce, Ga.—See "Water."

Great Lakes, North Chicago, Ill.—Bids will be received at the Bureau of Navigation (W. H. Brownson, Ch.), Navy Dept., Washington, D .C., until Aug. 21 for the laying of sewers and drains at the naval training station, Great Lakes, North Chicago, Ill., as advertised in The Engineering Record.

**Benton, Ill.*—B. S. Crain, of Marion, is reported to have secured the contract for constructing a sewerage system (bids opened July 22), for $17,000.

Collinsville, Ill.—Bids will be received until Aug. 20 by the Bd. of Local Improv., (J. L. R. Wadsworth, Chmn.), for constructing a sanitary septic sewer system in Dist. No. 1.

Chicago, Ill.—Bids will be received until Aug. 7 by the Bd. Local Improv. (H. S. Dietrich, Pres.), for constructing tile pipe sewers in portions of numerous streets; also constructing drains in portions of several streets.

Indiana Harbor, Ind.—The City Council is reported to have decided to expend $500,000 for a sewerage system for East Chicago and Indiana Harbor.

Gas City, Ind.—Bids will be received by Geo. F. Marchal, City Clk., until Aug. 13 for the construction of a sanitary and storm sewer system in different streets and alleys, in all about 3.1 miles, as advertised in The Engineering Record; approximate cost, $24,000. Engineer, T. E. Petrie, City Bldg., Marion, Ind.

Indianapolis, Ind.—Bids will be received until Aug. 9 by the Dept. Pub. Wks. (Jos. G. Elliott, Pres.), for constructing a pipe sewer varying in size from 10 to 15-in., in portions of Market and Davidson Sts.

Chas. A. Brown, Asst. City Engr., writes that the contract for constructing the Kentucky Ave. sewer (bids opened July 17), has been awarded to Morris Defrees, Sacks Bldg., Indianapolis, for $48,000.

*Chas. A. Brown, Asst. City Engr., writes that the contract for constructing the Missouri St. sewer (bids opened July 19) has been awarded to Shehan Constr. Co., 534 Bell St., for $21,000.

Princeton, Ind.—The plans of E. E. Watts, City Engr., are reported to have been adopted for a sanitary sewerage system, to cost about $60,000.

Evansville, Ind.—Bids will be received by the Bd. of Pub. Wks. (Walter F. Wunderlich, Clk.), until Aug. 30 for the construction of the Kentucky Ave. sewer, as advertised in The Engineering Record. Bids will be submitted on both reinforced concrete and brick.

It is reported that the Bd. Pub. Wks. (W. F. Wunderlich, Clk.), will receive bids until Aug. 13 for the construction of a main sewer and 2 local sewers of vitri. pipe from 15 to 10-in.

Davenport, Ia.—Bids will be received until Aug. 6 by the Bd. Pub. Wks. for constructing sewers in Park Lane, Scott, Warren and 9th Sts., in all about 4,590 lin. ft. 12-in. pipe. Thos. Murray, City Engr.

Grinnell, Ia.—Bids will be received until Aug. 6 by E. B. Wiley, Mayor, for furnishing material and constructing a sanitary sewer and extension to the water system, consisting of about 18,400 of vitrified sewer tile and cement and 30 ft. of iron sewer pipe, and 18,400 ft. of water main of iron and galvanized iron pipe. Willis Davis, City Clk.

**Webster City, Ia.*—P. M. Banks, City Clk., writes that the following are the bids opened on July 24 for constructing about 16,631 ft. of sanitary sewers: Sullivan & O'Connor, Webster City, $31,598 (awarded contract); Independent Contr. Co., Davenport, $32,185; Parks & Gerber, Williams, $33,140; E. L. Brown, Ottawa, Ill., $35,923; H. L. Gary, Denison, $38,120, and H. L. Hossack, Ottawa, Ill., $39,787.

Wichita, Kan.—The lowest bid recently received for constructing the West Side sanitary sewer is reported to have been submitted by McIntyre & Teese for $71,978.

Milford, Mass.—Bids will be received until Aug. 8 for 7,000 ft. 6 to 12-in. sewer, 800 ft. 8-in. force main, concrete pump well, pumping station, etc., as advertised in The Engineering Record. Jas. E. Walker, Chmn. Com. Engineer, F. A. Barbour, of Boston.

Athol, Mass.—Bids will be received until Aug. 20 by the Sewer Comrs. (Herbert L. Hapgood, Chmn.), for constructing about 8,500 ft. of sewers.

Iron River, Mich.—Bids will be received by Chas. A. Otto, Village Clk., until Aug. 7 (readvertisement) for the construction of sewers in Main Dist. No. 1 as advertised in The Engineering Record. Engineers E. G. Bradbury and G. P. Shute, 85 N. High St., Columbus, O.

**Lansing, Mich.*—The following are the bids recently received by City Clk. for the Park Pl. sewer: W. H. McKale, $21,000; J. H. Algate, $20,800, and M. E. Fitzpatrick, St. Joseph St., Lansing, $18,000 (awarded contract).

Jackson, Mich.—It is proposed to construct reinforced concrete trunk sewers here at a cost of $30,000. A. W. D. Hall, City Engr.; J. Harrington, City Recorder.

Detroit, Mich.—Bids will be received until Aug. 8 by the Dept. Pub. Wks. (J. J. Haarer, Comr.), for furnishing material and constructing a portion of Schroeder Ave. sewer.

Howell, Mich.—See "Public Buildings."

St. Paul, Minn.—The City Engr. is reported to have submitted to the Bd. of Pub. Wks. estimates for a new system of sewers in the southern part of the 2d Ward, including sewers in Hastings Ave., Point Douglas Road, Douglas St., and other streets; probable cost, $35,000.

**Virginia, Minn.*—A. Bickford, City Clk., writes that the contract for constructing sewers in Dists. Nos. 3E, 3D and 3C (bids opened July 23) has been awarded to C. C. Butler, for $4,798.

Willmar, Minn.—Bids will be received until Aug. 12 by the City Council for furnishing material and constructing sewers in portions of Trott Ave., 8th, 9th and 10th Sts., to comprise approximately 2,520 ft. 12-in. and 1,110 ft. 18-in. pipe. H. Gunderson, City Clk.

Vicksburg, Miss.—Sewer bonds to the amount of $200,000 are about to be sold for the proposed system of house and storm sewers, for which Walter G. Kirkpatrick, of Jacksoin, is preparig plans. H. J. Trowbridge, City Clk.

Canton, Miss.—Walter G. Kirkpatrick, of Jackson, is now preparing plans for a system of house sewers for Canton; about 8 miles in length. O. S. Miller, Mayor.

Webster Groves, Mo.—Bids will be received until Aug. 19 by L. B. Ripley, City Clk., for constructing district sewers with necessary appurtenances in Sewer Dist. No. 1. The principal items of the work are: 50,800 ft. 9 to 18-in. pipe, 54 flush tanks, 1 septic sewage disposal plant, capacity 70,000 gals. daily; also for sewers in Dist. No. 2, principal items, 42,800 ft. 9 to 15-in. pipe, 49 flush tanks, 1 septic sewage disposal plant, capacity 42,000 gal. per day. Specifications, etc., may be obtained at the office of R. E. McMath Surveying Co., 328 Lincoln Trust Bldg., St. Louis.

Kansas City, Mo.—Bids will be received until Aug. 8 by the Bd. Pub. Wk. for contructing sewers in Dist. No. 176, Sewer Dst. No. 2. E. A. Harper, City Engr.

Cape Girardau, Mo.—Bids will be received until Aug. 19 (readvertisement), by Geo. E. Chappell, City Clk., for furnishing material and constructing a complete system of sewerage in Sewer Dist. No. 1, comprising about 12 miles of pipe sewers 8 to 24-in. in diam., together with all necessary appurtenances.

Omaha, Neb.—Bids will be received by Andrew Rosewater, City Engr. until Aug. 26 for the construction of storm water sewers and appurtenences as advertised in The Engineering Record.

Elizabeth, N. J.—Bids will be received until Aug. 15 by the City Council for furnishing material and constructing sewers in 2d and 4th Aves.; Christie and John Sts., requiring about 3,057 lin. ft. 15, 12, 10 and 6-in. pipe, etc. N. K. Thompson, St. Comr.

Asbury Park, N. J.—Bids will be received until Aug. 17 by the Dept. of Water and Sewers (John E. Coffin, Supt.), 711 Asbury Park, for furnishing material and constructing about 10 miles of pipe sewers from 6 to 15-in. diam. with manholes, lampholes, flush tanks, and c. i. pipe complete; also same date and place for fur-

* *Items marked thus give the names of parties awarded contracts.*

nishing material and laying 1,200 ft. 12-in. wrought iron sewer outlet pipe, extending seaward from tide mark. Stuart Rogers, City Engr.

**New Brunswick, N. J.*—The contract for constructing sewers on Codwise, Throop and Easton Aves (bids opened July 1st) has been awarded to Middlesex Contr. Co., of George St.

Newark, N. J.—The Passaic Valley Sewerage Comn. at a meeting in the Prudential Bldg. on July 23 is reported to have authorized Allen Hazen, St. Paul Bldg., New York, N. Y., to prepare estimates on preliminary plans for building the proposed trunk sewer.

Ft. Lee, N. J. The citizens are reported to have voted to construct a sewerage system; probable cost, $420,000.

Riverside, N. J.—Bids will be received by Irven Kollo, Township Clk., until Aug. 19 for the construction of a sewerage system to consist of 10 miles of sewers 8 to 24-in. diam., pump house, engines, pumps, pump well and disposal works, as advertised in The Engineering Record. Engineer Wm. H. Boardman, 427 Walnut St., Philadelphia, Pa.

Madison, N. J.—S. G. Willets, Boro. Clk., writes that an election will probably soon be called to vote on the question of constructing sewerage system and disposal plant; cost reported to be $125,000.

Fulton, N. Y.—O. C. Breed, Ctiy Engr., is reported to be preparing plans and specifications for the construction of laterals to the West Side sanitary trunk sewer.

New York, N. Y.—Bids will be received until Aug. 6 by Louis F. Haffen, Pres. Boro. Bronx, for constructing sewers in portions of Garrison Ave. and Bronx St., and rebuilding portion of sewer in E. 149th St. Engineer's estimate: 1,200 lin. ft. 12, 15, 18 and 30-in. pipe sewer; 5,900 lin. ft. piles; 14,500 lbs. steel bars, ½ in., ⅝ in. and ¾ in.; 1,410 lbs. steel in 20-in. "I" beams; 22,500 ft. timber, etc.

Bids will be received until Aug. 12 by the Boro. Pres. (Heory S. Thompson, Acting Boro. Pres. anad Comr. Pub. Wks.), for furnishing material and reconstructing outlet sewers and appurtenances, overflows and connections at 42d and 43d Sts., North River, and in 42d and 43d Sts., betw. North River and 11th Ave. Engineer's estimate: 1,150 ft. wooden barrel sewer 4 ft. 6 in., 10 lin. ft. twin brick sewers 4 ft. 6 in. interior diam. Class I, 45 lin. ft. brick sewer 4 ft. 6in.x9 ft. Class II, 100 lin. ft. brick sewer 4 ft. 6-in.x9 ft. Class III, 60 lin. ft. overflow chamber brick sewer of varying interior diam. Class IV, 170 lin. ft. brick sewer 6 ft. 6-in.x9 ft. Class V, 70 lin. ft. twin brick overflow sewers 8 ft.x2 ft. Class VI, 50 lin. ft. twin brick overflow sewer 8 ft.x2 ft. Class VII, 206 lin. ft. brick sewer 4 ft.x2 ft. 8 in. Class VIII, 123 lin. ft. brick sewer 4 ft.x2 ft. 8 in. Class IX, 90 lin. ft. 12-in. salt glazed vitr. stoneware pipe culvert, 4 receiving basins of circular pattern, 50 M ft. timber and plank for bracing and sheet piling, 8 M ft. timber and plank for foun., etc., 50 M ft. timber and plank for approaches.

Buffalo, N. Y.—Francis Ward, Comr. of Pub. Wks., is reported to have presented to the Bd. of Aldermen two plans for a sewer to abate the Cornelius Creek flood. One is for an overflow sewer to cost $95,000, and the other for a reinforced concrete drain to cost about $75,000.

Oneida, N. Y.—It is stated that bids will be received until Aug. 6 for constructing a sewer in a portion of Lenox Ave. T. A. Dapson, Deputy City Clk.

Shelby, N. C.—See "Water."

**Wahpeton, N. D.*—Wm. R. Purden, City Aud., writes that the contract for constructing sewer in Dakota line (bids opened July 27), has been awarded to C. H. Porritt, of Fargo, for $9,732.

St. Bernard, O.—Bids will be received until Aug. 6 by Geo. Schroeder, Village Clk., for constructing a sewer in Carthage Pike. J. A. Stewart, Engr., 712 Traction Bldg., Cincinnati.

Youngstown, O.—Bids will be received until Aug. 12 by the Bd. Pub. Service (W. H. McMillin, Clk.), for constructing sewers in portions of Walnut and Bane Sts.

Bucyrus, O.—It is stated that bids will be received until Aug. 12 by Chas. Meyer, Clk. Bd. Infirmary Directors, for plumbing at the county infirmary and for a sewerage system and disposal plant.

Arlington Heights, O.—We are informed that H. C. Innis, Village Engr., Station R, Cincinnati, has been instructed to prepare plans for a sanitary sewerage system. Will vote on bonds for same at November election.

**Columbus, O.*—The Columbus Machine Co., of Columbus, is reported to have on July 24 secured the contract from the Bd. of Pub. Service for the pumping machinery to be installed in the East Side sewage pumping station for $13,255.

Bids will be received until Aug. 14 by the Bd. Pub. Service (Edw. F. McGuire, Secy.), for constructing sewers in several alleys and a portion of Wall St.

Norwood, O.—Bids will be received by the Bd. of Pub. Service until Aug. 17 for furnishing material and constructing receiving basins and air tanks, and laying 4 and 8-in. pipe in Serpentine Ave. for the purpose of conveying sewage from Duck Creek to Bloody Run, as advertised in The Engineering Record.

Medina, O.—The following are the lowest bids opened on July 16 for sewers at Medina: Dist. No. 1 and 2, J. O'Neill, of Akron, $7,315 and $19,405, respectively; and sewage disposal plants, Medina Contr. Co., Medina, at $1,880 for South Side plant and $1,764 for North Side plant. Engineers, E. G. Bradbury and Geo. P. Shute, 85 N. High St., Columbus.

**Salem, O.*—Devine, Wilson & Applegate, of Alliance, have secured the contract for constructing the trunk line sewer (bids opened July 17), at the following bid: 17,100 cu. yds. earth excav., 64 cts.; 6,250 ft. 24-in. sewer pipe, $1.30; 3,060 ft. 18-in. sewer pipe, 90 cts.; 2,664 ft. 15-in. sewer pipe, 60 cts.; 1,786 ft. 12-in. sewer pipe, 45 cts.; rock excav. $2.00 per cu. yd., and 33 manholes, ea., $45; total cost, $26,520. Ferguson & Purcell, of Lorain, bid for this work $28,267.

Cambridge, O.—Bids will be received by the Bd. of Pub. Service (H. P. Woodworth, Pres.), until Aug. 10 for furnishing material and constructing portion of sanitary system of sewerage, as advertised in The Engineering Record. O. M. Hoge, City Engr.

Eaton, O.—The citizens on July 22 voted to issue $125,000 bonds for the construction of a sewerage system. Bids will probably be called for in Oct. A. L. Reid, City Engr.

New Philadelphia, O. See "Paving and Roadmaking."

**Cincinnati, O.*—The L. Drach Constr. Co., 206 E. 4th St., is reported to have secured the contract for constructing sewer in Main and Excelsior Sts for $6,381.

Delaware, O.—Bids will be received until Aug. 23 by the Bd. Trus. Girls' Industrial Home (T. F. Dye, Secy.) for constructing a sewage disposal plant at above home, to consist of about 5,040 ft. 3, 6, 8, 10 and 12-in. sewer pipe, 3,004 lbs. c. i. specials, 4,764 lbs. steel, 1,378 cu. yds. crushed stone, etc. E. G. Bradbury and G. P. Shute, Engrs., 85 N. High St., Columbus.

Pawhuska, Okla.—See "Water."

Panama.—See "Miscellaneous."

**Harrisburg, Pa.*—Opperman & Opperman, of Harrisburg, are reported to have secured the contract for constructing Mish Hollow sewer (bids opened July 5), for $36,344.

Allegheny, Pa.—The State Comr. of Health is reported to have instructed Simon Kirschler, Dir. Dept. of Charities of Allegheney, to prepare plans for sewage disposal plant for city home and insane asylum at Claremont.

Taylor, Pa. Bids will be received until Aug. 6 by the Town Council (John F. Tubbs, Chrmn.) for constructing a lateral sewer in the 2d Sewer Dist. A. B. Dunning, Boro. Engr., 803 Mears Bldg., Scranton.

**Vermillion, S. D.*—The contract for constructing sewerage system at Normal School (bids opened July 1) has been awarded to Symns-Powers Co., of Sioux Falls.

**Brookings, S. D.*—J. R. Thompson, City Engr., writes that G. W. Haggert, of Fargo, N. D., has secured the contract for sewers and a disposal plant (bids opened July 15), at the following bid: 2,600 ft. 15-in. pipe sewers, $2.18; 200 ft. 12-in. pipe sewers, $1.55; 6,510 ft. 10-in. pipe sewers, $1.31; 48,650 ft. 8-in. pipe sewers, $1.21; total for sewerage system, $58,866. For septic tank and 3 filter beds, $7,785; 1,982 ft. 24-in. outlet sewer, $2.50; 666 ft. 18-in., $1.90, and 200 ft. 12-in., $1.44; total for disposal plant, $14,293. Totals of other bids received were: (*a*), sewerage system; (*b*), disposal plant: G. S. Redmon, Pipestone, Minn., *a*, $59,839; *b*, $14,547; W. J. Gray & Co., Minneapolis, Minn., *a*, $59,353.

Waco, Tex.—Sewer bonds to the amount of $60,000 are reported sold.

**Salt Lake City, Utah.* Jas. Kennedy, of Fargo, N. D., is reported to have secured the contract for constructing sewers in Salt Lake City, for about $212,870.

Spokane, Wash.—The Bd. of Pub. Wks. is reported to have decided to recommend to City Council the construction of a trunk sewer.

Bluefield, W. Va.—We are informed that the Bd. of Supervisors will expend about $25,000 for sewers. Engineer, Geo. H. Hall, of Bluefield.

Marshfield, Wis.—It is stated that bids will be received until Aug. 10 by M. G. Fleckenstein, City Clk., for constructing a sewer in 6th St.

BRIDGES.

Notes Arranged Alphabetically by States.

Talladega, Ala.—It is stated that bids will be received by the Co. Comrs. until Aug. 12 for constructing 2 steel bridges.

**Redding, Cal.*—The Bd. of Supervisors are reported to have awarded the contract July 10 for the construction of a bridge over the Sacramento River at Redding, to the Burrell Bridge & Constr. Co., of Oakland, at $35,970.

**Keswick, Cal.*—The Western Bridge & Constr. Co. is stated to have secured the contract to rebuild the county bridge across Sacramento River at Keswick at $6,800.

Greeley, Colo.—G. A. Houston, of Denver, Deputy State Engr., writes that all bids opened on July 23 for a reinforced concrete bridge over Cache La Poudre River at 5th St., Greeley, have been rejected; bids received ranged from $6,690 to $7,400.

Ripley, Ill.—The Bd. of Superv., it is stated, has been petitioned to construct a bridge over Crooked Creek above Ripley between Brown and Schuyler Counties, to cost about $4,000.

**Indianapolis, Ind.*—The contracts for the 3 concrete bridges to be built in the public parks is stated to have been awarded by the Park Bd., July 10, as follows: To Hillis F. Hackedorn & Co., Brookside bridge $5,875, Garfield bridge $7,518 and Spades Place bridge $2,549.

Indianapolis, Ind.—It is reported that the Bd. Co. Comrs. will receive bids until Aug. 7 for the construction of 3 bridges and 8 concrete culverts. C. J. Clark, Co. Aud.

Shelbyville, Ind.—It is reported that the Bd. Co. Comrs. will receive bids until Aug. 6 for the construction of a 75-ft. span reinforced concrete arch bridge over Sugar Creek, Morel Township. Thos. Hawkins, Co. Aud.

Sante Fe, Ind.—Bids will be received until Aug. 7 by the Bd. Co. Comrs., at Peru, for constructing a steel or concrete bridge across Big Pipe Creek south of the town of Santa Fe. Chas. Griswold, Co. Aud.

Plymouth, Ind.—Bids will be received until Aug. 6 by the Bd. Co. Comrs. for constructing 8 iron bridges and one set of abutments for bridge in German Township. H. L. Singrey, Co. Aud.

Princeton, Ind.—The Comrs. of Gibson County are reported to have ordered plans for the construction of an iron bridge over the Patoka River, known as the Severn Bridge.

Marion, Ind.—It is reported that bids will be received until Aug. 6 for constructing 5 concrete arches, one steel bridge with concrete abutments and floor, two concrete retaining walls, one concrete bridge floor, and the roofing of the New Cumberland bridge. Harry Goldwaite, Co. Aud.

Council Bluffs, Ia.—Bids will be received by W. F. Sapp, City Clk., until Aug. 19 for furnishing material and constructing 2 reinforced concrete bridges with retaining walls, etc., across Indian Creek, one at Frank St., the other at 8th St., as advertised in The Engineering Record. S. L. Etnyre, City Engr.

Cedar Rapids, Ia.—The City Council has adopted a resolution directing the City Engr. to prepare plans and estimates of cost of constructing a steel and concrete bridge at 16th Ave.

Salina, Kan.—It is stated that bids will be received until Aug. 8 by J. P. Burns, Co. Clk for two 60 ft. span steel bridges and a 45-ft. span steel bridge.

New Orleans, La.—Two bids are reported to have been been received July 15 by the Council for constructing a bridge across Bayou St. John at Esplanade St. One was considered informal. The other bid was from the Ottumwa Bridge Co., of Ottumwa, Ia., at $47,900.

Conowingo, Md.—The stockholders of the Conowingo Bridge Co., it is reported, have decided to issue $75,000 bonds to rebuild the bridge at Conowingo, which connects Cecil and Harford Counties. J. Hayward Harlow, Engr., Darlington, Md.

**Boston, Mass.*—Jones & Meehan, 1 Beacon St., have secured the contract for alterations to bridge bet. Chelsea and Boston, for $5,740 (bids opened July 25 by the Boston Bridge Comn.). Patk. F. McDonald, Supt. of Bridges.

Menominee, Mich.—The City Council of Menominee and the City Council of Marinette, Wis., are said to be considering the construction of a steel bridge at the first dam to replace present wooden structure.

The lower draw bridge over Menominee River is reported to have been badly damaged by a collision with a steamer, and it is stated it will cost $12,000 to make repairs.

Independence, Mo.—It is stated that bids will be received until Aug. 7 by S. A. Boyer, Co. Clk., for constructing a reinforced concrete bridge with two 30 ft. spans on Holmes Park Rd. over Heart Grove Creek.

Kansas City, Mo.—The Lower House of the Council on July 15 passed an ordinance giving permission to the Commercial Improv. Co. to construct a viaduct on Main St. from 20th to 23d Sts. It will be a foot, wagon road and street car structure, and is to cost about $110,000. The Metropolitan Street Ry. Co. will operate the cars over it as far as 27th St., where connections will be made with the cars using the Main St. tracks. When the viaduct is finished it will be deeded to the city to own and maintain.

South Omaha, Neb. Engineers of the Chicago, Rock Island Pacific Ry. (W. H. Peterson, Bridge Engr., Chicago, Ill.), it is stated, have made surveys and made a report recommending the construction of a viaduct in lower Albright, South Omaha, over the railroad tracks.

Rahway, N. J.—Bids will be received until Aug. 7 at the Court House, Elizabeth, for cnstructing a reinforced concrete bridge across the Robinson Branch of the Rahway River at Rahway. Span 60 ft., width 46 ft. J. L. Baner, Co. Engr., 215 Broad St., Elizabeth.

South Orange, N. J.—It is stated that bids will be received until Aug. 6 by G. F. Drum, Co. Engr., Newark, for constructing a bridge on W. Turrell Ave., South Orange.

Trenton, N. J.—Bids will be received until Aug. 10 (readvertisement) by the Bd. Chosen Freeholders (Ammi R. Schanck, Dir.) for furnishing material and constructing a combination steel and concrete bridge across Hannah Moore's Brook, Hopewell Township. Frank J. Eppell, Co. Engr., also same time and place for constructing a combination steel and concrete bridge over stream crossing Dutch Neck and Grover's Mill Rd., West Windsor Township.

**Utica, N. Y.*—The contracts for the work of repairing and constructing the bridges over Real's Creek and the new channel of the Mohawk River on N. Genesee St., have been let to J. C. Dewhurst. The bridge over Real's Creek will have the wood supports taken out and iron supports substituted. This is made necessary because of the projected electrification of the Deedfield St. car line. Also with this object in view the old rails are being torn out and better ones put in their places. The bridge over the new river channel will be entirely of iron, and although not a new bridge. Two abutments are to be erected on either side of the river.

Rochester, N. Y.—See "Paving and Roadmaking."

Westfield, N. Y.—The citizens are stated to have voted to issue $35,000 bonds, the city portion toward constructing a viaduct over Chautauqua Creek. The structure to be 1,000 ft. long and 50 ft. wide. The Buffalo & Lake Erie Traction Co. to expend $50,000 on the bridge.

**New York, N. Y.*—The following are the bids received July 18 by J. W. Stevenson, Comr. Bridges for furnishing and delivering spruce plank for the Brooklyn Bridge: D. M. Resseguie, $15,720 (awarded contract); Brooklyn Lumber Co., $19,500; Arthur C. Jacobson & Sons, $20,580.

The following are the bids opened on July 23 by Jas. W. Stevenson, Comr. of Bridges, for making test borings at the site of new bridge over East River, bet. Manhattan and Brooklyn Boroughs (price given per cu. yd.): Grant Roher, 299 Bway., $7.41; Williams Eng. & Contr. Co., 13 Park Row, $5.95; Manhatan Drilling Co., $6.75; American Test Boring & Drill Co., $7.68; Healey Sewer Machine & Contr. Co., 21 Park Row, $4.79, and American Diamond Rock Drill Co., $11.25.

The following are the bids opened same time and place for construction of trolley railway approaches to the Brooklyn Bridge, in Brooklyn Boro.; Snare & Triest Co., 143 Liberty St., $106,280; Chas Meads Co., 299 Bway., $95,400, and J. H. Gray & Co., $106,700.

Tarboro, N. C.—Bids will be received until Sept. 2 by the Chmn. Bd. Co. Comrs. for constructing a steel bridge 20 ft. long, 18 ft. wide, with 60-ft. draw across Tar River, near Tarboro.

New Lexington, O. It is stated that bids will be received until Aug. 6 by Geo. T. Drake, Co. Aud., for constructing a bridge over Rush Creek, at Main St., East Liverpool.

Cleveland, O. The City Council is reported to have

passed an ordinance providing for an appropriation of $22,000 to complete Jefferson Ave. bridge.

Lebanon, O.—Bids will be received by S. A. Stillwell Co. Notes Arranged Alphabetically by States.

Citronelle, Ala.—The City Council is reported to have granted a franchise to the Citronelle Light & Power Co. The company is composed of business men of Hattiesburg, Miss. An ice plant is also promised by these same parties as soon as the electric light plant is complete.

San Francisco, Cal.—Bids will be received until Aug. 29 by Jas. Knox Taylor, Superv. Archt., Washington, D. C., for furnishing and delivering motors, rheostats, chain drives, air compressor, circuit breakers, conduit, wire, etc., at the U. S. Postoffice and Court House, etc., San Francisco.

Boulder, Colo.—The Perfect Light Co. is reported incorporated with a capital of $50,000 by C. W. Sanborn, W. L. Seely and others.

Washington, D. C.—Bids were opened on July 20 at the office of the Supt. U. S. Capitol Bldg. and Grounds for weatherproof and rubber covered electric wire for office building, House of Representatives. The National Electrical Supply Co., Washington, D. C., bid on the entire material $24,338, and on weather-proof wire only $20,701, and for the rubber covered wire only $3,637. The Simplex Electrical Co., Boston, Mass., submitted 3 bids for rubber covered wire only, namely, $3,803, $4,780 and $4,880.

Bids will be received at the Bureau of Supplies and Accounts at the Navy Dept., Washington, D. C., until Aug. 6 to furnish at the navy yards and naval stations a quantity of naval supplies, as follows: Boston, Mass., Sche. 94—Milling attachment, etc. Sche. 120—Spruce, yellow pine. Sche. 121—Electric operating equipment. Norfolk, Va., Sche. 94—Turret lathe. Sche. 118—Arches and jamb bricks, retort cement. Sche. 131—Portland cement. Charleston, S. C., Sche. 94—Emery grinders. Sche. 121—Motor drives. Portsmouth, N. H., Sche. 95—Planing machines. Sche. 118—Cells, iron wire, electro-mechanical gongs. League Island, Pa., Sche. 122 and pump, Sche. 126 white oak; Washington, D. C. Sche. 119—Copper tubing, sheet copper, brass, lead, galvanized steel, black iron and tin. Sche. 120—Steel tank. Sche. 125—Drill chucks, reamers, turning tools, etc. Sche. 126—White and yellow pine. Sche. 127—Drill rod. Mare Island, Cal., Sche. 137—Brick, windows, lumber piles, paper wall board. Sche. 138—Redwood, Oregon pine. Puget Sound, Wash., Sche. 136—Chucks, drills. Sche. 139—Iron pipe and fittings. Portsmouth, N. H., Sche. 150—Motor. Sche. 153—Bolt sand nuts, drills, etc. Sche. 154—White pine, spruce. Sche. 155—Zinc plates, tool steel. Sche. 158—Brass, copper and galvanized pipe, pipe fittings, valves. Also until Aug. 13 as follows: Boston, Mass., Sche. 135—Vertical boring mill, pipe flanging machine. Sche. 149—Plumbing fixtures, valves. Sche. 155—Rolled bronze, brass sheet. New York, N. Y., Sche. 117—Searchlight projectors, generating sets, incandescent lamps, portable testing sets, testing generators, keyboards, gonda cells, dynamotors, interior fittings and fixtures, branch boxes, etc., switch handles, steel and brass enameled conduit and fittings, conductor, etc. Sche. 134—Hydraulic accumulator. Sche. 155—Rolled bronze, brass sheet, bar iron, plain and corrugated galvanized sheet steel, bar and plate steel, sheet tin and zinc. Sche. 158—Iron or steel pipe, pipe fittings, brass unions. League Island, Pa., Sche. 151—Incandescent lamps, arc-lamp globes and parts, switches, rubber-covered wire, electrical supplies. Washington, D. C., Sche. 148—Air drills, sheet copper and lead. Sche. 151—Incandescent lamps, globes and repair parts for arc lamps, switches, flexible steel conduit, electrical supplies. Sche. 158—Loricated iron pipe. Charleston, S. C., Sche. 133—Construction of pent-house, cutting out rudder pit in dry dock. Sche. 149—Motors. New Orleans, La., Sche. 140—Tile drain pipe, etc. Key West, Fla., Sche. 141—Yellow pine. Pensacola, Fla., Sche. 140—Yellow pine, metallic shingles, galvanized iron coping, etc. Sche. 141—White oak, yellow pine. Sche. 142—Brick, Portland cement, etc., spikes, bilge pumps, windlasses, copper sheathing, galvanized iron, bar steel. Applications for proposals should designate the schedules desired by number. E. B. Rogers, Paymaster Gen'l, U. S. N.

Hawaii.—Bids will be received until Aug. 22 by the Light House Engr., Tompkinsville, S. I., N. Y., for furnishing one first order lantern for Makapuu Point, Hawaii, Light Station.

Pekin, Ill.—It is reported that plans have been prepared by the Pekin Electric Light Co. for improvements, which will cost about $50,000.

Scottsburg, Ind.—The question of lighting the city by electricity and building water works is reported as being agitated here. A franchise may be granted.

Princeton, Ind.—It is reported that bids will be received by the Consumers Gas and Light Co., until Aug. 5 for the construction and equipment of artificial gas plant; estimated cost, $60,000.

Seelyville, Ind.—F. M. Fauvre, Pres. of the Louisville & Eastern R. R. Co., of Louisville, Ky., is reported interested in a company about to be formed for the construction of a power plant near Seelyville, to transmit electricity to Indianapolis.

Red Fork, Ind. Ter.—For the purpose of developing water power for factory uses, steps are being taken toward making a cut-off of Arkansas River north of this place. The project embraces a canal 3 miles long. The canal will take water from Arkansas River 2 miles west of Red Fork; estimated cost of the work, including power dam, $700,000. J. A. Mackin and Dr. C. H. Bland are reported interested.

**New Hampton, Ia.*—Shepard & Hutton are reporten to have secured contract for constructing power plant for $8,611.

Galena, Kan.—The Galena Light & Power Co. (E. St. George Noble, Mgr.), is making arrangements for a complete change in present system.

Versailles, Ky.—The Electric Light Co. (Harry Reid, Mgr.), will extend line to Midway, Ky., several miles.

* *Items marked thus give the names of parties awarded contracts.*

Pittsfield, Mass.—Ley & Co., of Springfield, are reported to have secured the contract to build a subway from the Stanley power houses on east shore of Silver Lake to the Morningside and lower East St. shops. The subway, which is to be of concrete, will be 7 ft. high and 6½ ft. wide, ½ mile in length, and will be used as a conduit for steam pipes and electric power, testing and lighting wires. All of the wires and pipes now above ground will be placed in this conduit as soon as it is finished in the fall; cost about $25,000.

Concord, Mass.—A complete coal handling plant will be installed in Municipal Electric Light plant. Estimates are wanted.

Charlotte, Mich.—It is reported that the Michigan Power Co. proposes constructing a line to Charlotte to furnish street lighting.

Pontiac, Mich.—E. E. Betchell, Consulting Engr. of the Pontiac Lighting Co., is reported to be preparing plans for remodeling the power plant of this company. Engines, boilers and generators will be installed. T. H. Weber is Supt.

Bovey, Minn.—Frank McCormick, of Duluth, is reported to have secured a franchise for electric lighting.

Water Valley, Miss.—It is proposed to purchase 300 h. p. water tube boiler for the City Electric Light and Water Plant (T. M. Early, Mgr.).

Browning, Mo.—J. L. Kille, City Clk., writes that the citizens on July 22 voted to issue $6,000 bonds for an electric light plant. No engineer engaged as yet.

Billings, Mont.—The citizens are reported to have voted to grant a franchise to P. A. Williams, of Chicago, Ill., for the construction of a central heating plant and distributing system.

Harlowton, Mont.—John L. Bright, of Lewistown, is reported interested in the construction of an electric light plant at Harlowton.

Tecumseh, Neb.—Frank Dinsmore, City Clk., writes that bids are wanted until Aug. 19 for the construction of an electric light plant to cost about $20,000. Engineer, John Martz, of Seward.

Falls City, Neb.—John R. Crook, City Engr., writes that the citizens on July 16 voted to issue $25,000 bonds for water works, $10,000 for eelctric lighting and $5,000 for park work.

Reno, Nev.—Maj. J. A. Driffil, of Oakland, Cal., Pres. of the Ely Electric Co., and Carl Lennhart, of Los Angeles, are reported to be in this city, and state that the company will immediately begin the construction of a 1,000 h. p. electric plant and a large reservoir. The water for this reservoir will be furnished by Cave Creek and will be piped from the reservoir to the city, where it will be used for municipal purposes. A portion of the water will be used to operate the electric power plant.

Madison, N. J.—S. G. Willets, Boro. Clk., writes that the Light Com. has under consideration the doubling of the capacity of the electric light plant and may recommend same to Council at the Aug. meeting. Nothing definite has yet been done.

Schenectady, N. Y.—Press reports state that about $191,000 of the $3,232,000 that the Hudson River Electric Power Co., of Glens Falls, has made application to the Public Service Comn. at Albany to issue bonds for, will be spent on a transmission line between Schenectady and Ballston. The land needed for the new dam that the company will construct on the Sacandaga River will cost about $885,000, the dam and canal and power station at Conklinville will cost $802,000. A transmission line from Conklinville to Ballston with a connection to Spier Falls will cost $271,000, and a transmission line from Utica to Amsterdam will cost $709,000. C. E. Parsons, Ch. Engr., Glens Falls.

Lyons, N. Y.—The Wayne County Electric Co. (R. W. Kiple, Mgr.), is reported to be planning to enlarge its power plant.

Watertown, N. Y.—Eaton & Brownell, 54 Smith Bldg., have completed plans, specifications and estimates for the development of water power for the Watertown Marble Co., and they are in the hands of the owners for approval. It is doubtful if anything will be done this year.

West Point, N. Y.—Bids will be received by Maj. J. M. Carson, Jr., Q. M., U. S. M. A., until Aug. 19 for furnishing iron lamp posts and lanterns for electric street lights, as advertised in The Engineering Record.

Blackwell's Island, N. Y.—Bids will be received until Aug. 15 by Robt. W. Hebberd, Comr. Dept. Pub. Charities, N. Y. City, for furnishing materials and labor required for complete conduiting, electric wiring, and all other work in connection with the installation of a complete electric lighting and power system for all buildings and grounds under the jurisdiction of the Dept. of Pub. Charities, and comprising the city hospital Dist., Blackwell's Island, Boro. of Manhattan.

**New York, N. Y.*—Contracts for installing electric equipment in schools in Manhattan Boro. (bids opened July 22 by C. B. J. Snyder, Supt. School Bldgs.) have been awarded as follows: School 14 to Spiro Co., 121 Delancey St., $4,875, and School 29 to Reis & O'Donovan, Inc., 1123 Bway., for $4,740.

Bids will be received until Aug. 12 by C. B. J. Snyder, Supt. School Bldgs., N. Y. City, for installing electric equipment in the additional story of Public School 80, Boro. of Brooklyn, in addition to and alterations in Public School 13, and in addition to and alterations in Public School 19, both in Boro. Richmond, in Schools 91 and 66, Boro. of Manhattan, and for alterations to electric system in Morris High School, Boro. of the Bronx.

**Bath, N. Y.*—The Village Trus. are reported to have abandoned the idea of municipal ownership of the electric plant, and have entered into a contract with Bath Electric Light Co. to continue lighting of village upon expiration of present lighting contract in Sept. The company promises to install a duplicate set of machinery in the power plant.

Harrison, O.—The Harrison Electric & Water Co., of Harrison, is reported incorporated with a capital of $30,000 by Wm. F. Boyd, Edwd. Avesmer, Saml. L. Farland and others to acquire and operate the electric and water plant in Harrison and West Harrison.

Fremont, O.—The Fremont Power & Light Co. is reported to have completed plans for harnessing Sandusky River at this place, and erecting a power plant to cost $100,000, with an electrical output of 2,000 h.p.

Oklahoma City, Okla.—A. B. Hulit, of Chicago, Ill., is reported to have petitioned for an electric light and power franchise.

Coquille, Ore.—It is stated that the Coquille River Electric Co. (Frank Morse, Mgr.) will install a 150 kw. G. E. alternator, 3 phase, 2,300 volts.

Panama.—See "Miscellaneous."

Philadelphia, Pa.—It is stated that John R. Wiggins & Co., contractors, 721 Heed Bldg., will shortly erect a 2-story brick transforming station, 30x108 ft., at 1113 Arch St., for the Philadelphia Electric Co.; cost about $85,000. John T. Windrim, Archt., Commonwealth Bldg.

Aiken, S. C.—The Carolina Light & Power Co. (Harry Sudlow, Mgr., Aiken) is reported to have purchased the Anderson Shoals water power on Little Horse Creek, and will develop same with a view to erecting a plant there.

Aberdeen, S. D.—C. T. Freehauf, of Cresco, Ia., is reported to have petitioned for a franchise for an electric light plant.

Gary, S. D.—T. M. Anton, Town Clk., writes that it is proposed to construct an electric light plant at a cost of $5,000.

San Angelo, Tex.—It is stated that bids are asked until Aug. 15 by the San Angelo Gas Co. for improving the company's plant. A building, 30x70 ft., 20 ft. high, is to be erected and which, with equipment, will cost $50,000.

**Bryan, Tex.*—Mr. Preston, of the Bryan Water, Light & Power Co., is reported to have awarded contract for a 1-story brick building 50x60 ft. to Wheelock & Allen, of Bryan. The new building will be large enough to accommodate duplicate machinery.

Waco, Tex.—J. Henry, of Denver, Colo., with others are reported to have been at Bryan, Tex., on July 18 gathering data relative to the power plant they propose to establish in the lignite fields of Central Texas for the purpose of furnishing power to all towns from Waco to Houston.

Wausau, Wis.—The Wisconsin Valley Improv. Assoc. is reported to be considering the further development of Wisconsin River. G. D. Jones, Secy.

Ladysmith, Wis.—The John Hein Co. is reported to have decided to develop 12,000 h.p. at Big Falls, 10 miles north of Flambeau River.

J. C. Young is reported to have secured permission to construct dam on Jump River.

Marinette, Wis.—Perley Lowe, of Chicago, Ill., is reported to have in contemplation the development of Peshtigo River at Places Rapids, and transmitting same to Marinette.

Campbellford, Ont.—Bids will be received until Aug. 15 by Mayor W. J. Doxsee, for rock-cutting, concrete work, turbine wheels, generators anad about 2¼ miles of transmission line for power development at Middle Falls on the Trent River. John S. Fielding, Consulting Eng., 15 Toronto St., Toronto.

Kamloops, B. C.—The City Clerk writes that this city is at present gathering information in regard to producer gas plants, but is not yet ready to receive bids.

ELECTRIC RAILWAYS.

Notes Arranged Alphabetically by States.

Dothan, Ala.—It is reported that Wm. Crawford has requested the City Council for a street railway franchise to build and maintain a park about 3 miles out of the town, and therefore desires the use of Main St. in order to build the line.

San Diego, Cal.—The City Council is reported to have voted to grant the application of E. Bartlett Webster for a railroad franchise on A St., down 4th to F and out to 25th St. An ordinance was adopted by the Council accepting the bid of the San Diego Electric Ry. Co. for the franchises of B St. from 4th to the water front, and from C St. on 4th to B St.

Vallejo, Cal.—The Vallejo, Benicia & Napa Valley R. R. Co. (L. J. Perry, Gen. Mgr., Napa) proposes constructing an electric railway into Sacramento, making the Napa branch a feeder. The terminals will be Vallejo and Sacramento.

Napa, Cal.—Richard Hotaling, of the Napa & Lakeport R. R. Co., is reported to have in contemplation the building of an electric railway in the counties of Marin, Sonoma, Napa and Lake. The line will start at a point on Richardson Bay, opposite Sausalito, and run by way of Corte Madera to San Rafael.

Santa Rosa, Cal.—The Petaluma & Santa Rosa Ry. Co. (E. M. Van Frank, Gen. Mgr., Petaluma) is planning to extend its road from Sebastopol to Lake Jonive about a mile north of that town.

San Diego, Cal.—A concurrent resolution has been adopted by City Council granting a franchise to the Point Loma Electric R. R. Co. for a loop line from Roseville to Ocean Beach.

Waterbury, Conn.—The Waterbury & Milldale Tramway Co. is reported organized with Chas. H. Clark, Pres.; John H. Cassidy, Sec.; Edwin S. Todd, Treas.

Covington, Ga.—Application for charter of incorporation for the Middle Georgia Interurban Ry. Co. is stated to have been filed by Chas. F. Howe, Milledgeville; Wm. F. Smith, Robert F. Smith, Samuel P. Smith, Flovilla, and others. It is proposed to construct, equip and maintain a line of railroad from Griffin, Jackson, Mansfield and Social Circle, through the said counties of Spalding, Butts, Jasper, Newton and Walton, with branch or branches from some convenient point or points to Flovilla, in Butts County, and Monticello, in Jasper County. The length of the new line will be about 70 miles, running in an easterly and northerly direction. Capital, $200,000.

Fitzgerald, Ga.—The City Council is stated to have been requested to grant to S. T. Holtzendorf, W. T. Whiteny and B. K. Waldridge, of New York, and T. M. Parsons and C. A. Holtzendorf, of this city, and L. C. Holtzendorf, of Valdosta, a franchise to operate an electric railway within Fitzgerald and to suburban points.

Atlanta, Ga.—The Atlanta & Carolina Constr. Co. is reported to have surveyed the route of the proposed line between Atlanta anad Augusta. The route will be from Atlanta to Lithonia, thence to Conyers, Monroe, Athens, Washington and Augusta. W. English, Pres.; Matthew Mason, vice-pres. and Gen. Mgr.; M. T. Edgerton, Secy. Capital, $5,000,000.

Gary, Ind.—The Gary Street & Interurban Ry. Co. is reported incorporated with a capital of $400,000, to build and operate street and interurban railroads in and connecting Gary, Tolleston, Hammond, East Chicago and Whiting. Directors: Frank N. Gavitt, C. B. Manbeck and M. N. Casterman.

Angola, Ind.—The Railroad Comn. is stated to have granted a petition from the St. Joseph Valley Traction Co. and the Angola Light & Power Co. for a grade crossing of traction lines near Angola, reserving the right to cause the crossing to be changed later.

South McAlester, Ind. Ter.—The power house of the Choctaw Ry. & Electric Co. (J. H. Merrill, Gen. Supt.) was completely wrecked recently by the bursting of a fly-wheel.

Sapula, Ind. Ter.—It is stated that E. C. Reynolds and associates will commence work at once on the electric line in Sapula, and also to the oil fields south of the city.

Red Fork, Ind. Ter.—Articles of incorporation of the Midcontinent Traction Co. are reported to have been filed. The articles set forth the construction of an interurban electric line connecting Red Fork, Tulsa, Sapulpa and the Glenn Pool oil fields, a distance of 20 miles.

Newport, Ky.—The Bd. of Aldermen is stated to have passed the ordinance granting the South Covington & Cincinnati Ry. Co. the right to lay a track on 12th St.

Paducah, Ky.—It is stated that the Paducah Traction & Light Co. (H. T. Brown, Ch. Engr.) contemplates building an extension into Mechanicsburg.

Portland, Me.—The Portland, Gray & Lewiston R. R. Co. is reported incorporated, to build and operate an electric railway through Falmouth, Gray, New Gloucester, Auburn and Lewiston; capital, $150,000. Stockholders: Ed. W. Gross, of Auburn; Chas. C. Benson, of Lewiston; Lewis A. Goudy, of Portland, and others.

Baltimore, Md.—The Maryland Electric Rys. Co. is planning to build a number of extensions in and about the city. The following are the extensions to be made: From Highlandtown to Orangeville; from Towson to Lutherville; from Wilkens Ave. to Elkridge; from Catonsville to Towson; from Dickeyville to Loraine Cemetery, and a line through Guilford.

Springfield, Mass.—A franchise is stated to have been granted to the Springfield St. Ry. Co. to build a new line on Broadway.

Boston, Mass.—Bids will be received until Aug. 15 by the Boston Transit Comn. (B. Leighton Beal, Secy.) for constructing entrance and exit at Water and Devonshire Sts., for the Washington St. Tunnel.

Mankato, Minn.—Articles of incorporation are stated to have been filed by the Mankato Electric Traction Co. with the Secretary of State to build an electric railway in Mankato. Capital, $200,000. Incorporators: A. J. Whipple, Glencoe, Ill.; Celin C. H. Tyffe, Chicago; A. M. Hewes, Chicago, and others are reported interested.

Scranton, Miss.—It is reported that M. J. McDermott and Sidney Lowenstein, of the Bank of Mobile, Ala., and others are interested in the construction of an electric railway between Scranton and Mobile, about 40 miles in length; capital, $500,000.

Billings, Mont.—Yegen Bros., of Billings, are stated to have presented a petition to the City Council asking that a special election be held for the purpose of submitting to the voters the question of granting to the petitioners a franchise for the construction of a street railway. Yegen Bros. have recently completed an electric plant on the banks of the Yellowstone River, and it is presumed that in case the franchise is granted the electric power generated there will be used in the operation of a street railway.

Nyack, N. Y.—The West Shore Traction Co. is reported to have been granted authority by the New York State Board of Railroad Comrs. to construct a 25-mile high-speed electric road from Tomkins Cove along the Hudson River to the State line at Carteret, Rockland County; to increase its capital from $250,000 to $500,000, and to issue a first mortgage of $900,000. It is reported that the line will be ultimately extended from the State line to Jersey City and will enter New York City by way of the McAdoo tunnel. The company is being promoted by Searing & Co., bankers, of New York.

New York, N. Y.—See "Bridges."

Columbus, O.—A plan has been made for the connection of Columbus and Pittsburg by trolley. The intention is for the Wheeling Traction Co. to extend its line West by way of Barnesville and Neff's to meet the Columbus, Newark & Zanesville. In the other direction, the Rapid Transit Co. is to extend its road by way of Hickory, Pa., to Carnegie, where it will connect with the Pittsburg lines.

Elyria, O.—The Elyria Southern Ry. Co. is reported incorporated, with a capital of $100,000, by W. J. Elliott, F. N. Carpenter, W. E. Moser and others to build an electric railway between Elyria and West Salem.

Cleveland, O.—The Elyria Southern Ry. Co. is reported incorporated for the purpose of building an electric railway between Elyria and West Salem. Capital, $100,000. Incorporators: W. J. Elliott, F. N. Carpenter, W. E. Moser, J. M. Storr and F. L. Sargent.

Cuyahoga Falls, O.—Plans are stated to have been made for straightening the Akron, Bedford & Cleveland Division of the Northern Ohio Traction & Light Co. (R. Trumbull, Ch. Engr., Akron), from a point 5 miles north of here to Bedford. In some places it has been planned to move the track more than a mile east of where it now runs. If the plans are carried out, the road will have a private right of way.

**Columbus, O.*—John T. Adams, of Columbus, is reported to have secured the contract for ballasting the Indiana, Columbus & Eastern (W. Kesley Schoepf, Pres., Cincinnati) between this city and Springfield.

Lima, O.—Through condemnation proceedings, the Indiana, Columbus & Eastern (T. A. Nealy, Secy.,

* *Items marked thus give the names of parties awarded contracts.*

[illegible] is stated to have cleared up the right of way between Bellefontaine and this city. The steam line from here to Defiance is ready to electrify, and it is believed that the company will have cars running through from Cincinnati to Toledo some time this fall.

El Reno, Okla.—The El Reno Ry. Co. is reported to reported to have been granted a charter to build a steam or electric line 60 miles westward of Oklahoma City via El Reno to Geary, at an estimated cost of $100,000. Incorporators: J. W. Maney, Oklahoma City; John Maney, Henry Shafer, H. K. Shafer and Herman Mittmer, all of El Reno.

Hillsboro, Ore.—The City Council is reported to have granted a franchise to the Oregon Electric Co. on E. Line St., and also a franchise to the United Rys. Co. by way of Main St., with right to use 1st, 2d or 3d Sts. for connection with southern limits of city.

Johnstown, Pa.—It is reported that a contract will be let shortly to Umbenhauer & Co. for the grading of a 10-mile section of the Johnstown & Ebensburg R. R., which will connect Ebensburg and Johnstown. This work will include all excavating, the necessary concrete and masonry construction at culverts, etc., and the spanning of Elk Lick Creek with a bridge.

Scranton, Pa.—An extension of its line from Minooka to Rocky Glen is reported to be the latest improvement being considered by the Scranton Ry. Co. (Frank Caum, Gen. Mgr.). Surveyors of the company have gone over a proposed route and have reported that the proposition is feasible. The shortest route of the extension is about 2½ miles. The route proposed is from Minooka to Oak Hill and across country to the glen.

Denton, Tex.—Plans for an interurban line from Ft. Worth to Denton and from Denton to Gainesville via Slidell have been practically completed. It is reported that Stone & Webster people, of Boston, Mass., are behind the project.

Ft. Worth, Tex.—The Northern Texas Traction Co. (H. M. Flanders, Ch. Engr.) is stated to have filed with the City Secretary of North Fort Worth an application for a franchise to extend the Main St. line north from the Stock Yards to a point on Washington Heights.

Seattle, Wash.—The Priest Rapids Ry. Co. is reported incorporated by W. R. Rust, of Tacoma; H. K. Owens, M. B. Haynes and E. H. Gins, with a capital of $1,000,000, for the purpose of building and operating an electric railway 90 miles long in Douglas County. R. R. Rust is stated interested.

Waterville, Wash.—Articles of incorporation are stated to have been filed by the Northern & Southern Ry. Co., of Waterville, by A. L. Rogers, M. B. Howe, L. W. Matthews and A. E. Case. Capital, $7,000,000. The principal object is to build a railroad, either steam or electric, or both, from Waterville to Pasco. The line is to be about 175 miles long.

Vancouver, B. C.—The British Columbia Electric Ry. Co. is reported to be considering the extension of its system at Ft. Langley. R. H. Sperling, of Vancouver, Gen. Mgr.

Winnipeg, Man.—The City Council is stated to have notified the Winnipeg Electric Ry. Co. to proceed with the proposed extensions.

Woodstock, Ont.—It is reported to be the intention of the new owners of the Woodstock, Thames Valley & Ingersoll Electric Ry. Co. to construct the line between Ingersoll and Woodstock.

RAILROADS.

Notes Arranged Alphabetically by States.

Mobile, Ala.—It is reported that the Mobile, Jackson & Kansas City R. R. Co. (H. S. Jones, Ch. Engr., Mobile) will extend its line to the Ohio River at once. The road now extends as far as Middleton, Tenn. About $1,500,000 will be expended in improvements.

Denver, Colo.—The Denver & Rio Grande R. R. Co., (E. J. Yard, Ch. Engr., Denver), is reported to be preparing to double-track its road from Denver to Pueblo.

Boise, Idaho.—The Intermountain Ry. Co. is reported incorporated to build a railroad 45 miles in length from Boise River, near Barber dam, to Centerville. The incorporators are said to be stockholders in the Barber Lumber Co.

Columbus, Miss.—The Columbus, Memphis & Pensacola R. R. Co. is reported to have decided to extend its line from Columbus to Pickensville, Ala., a distance of about 25 miles.

Webb City, Mo.—Bids will be received until Sept. 1 by the St. Louis, Bartlesville & Pacific R. R. Co. (F. M. Overlees, Pres., Bartlesville, Ind. Ter.), for constructing and equipping said road from Webb City, Mo., to Pond Creek, Okla.

Jamestown, N. Y.—The management of the Jamestown, Chautauqua & Lake Erie Ry. Co. (C. M. Harrison, Supt., Jamestown) is reported to have secured permission from the bondholders of the road to issue $150,000 bonds to make improvements on the road, to include new ties, rails, roadbed and equipment.

Langdon, N. D.—The American Midland R. R. Co. is reported incorporated with a capital of $20,000,000 to build a line from Langdon, N. D., to near Galveston, Tex.; the proposed line is to have an estimated length of 2,100 miles. Directors: F. C. Guss, B. F. Hegler, Jr., and C. H. Haviglness, of Guthrie, Okla.; Henry Oppenheimer, Frank Jerome Hoyle and others of New York, N. Y.

Cameron, N. C.—The Randolph & Cumberland R. R. Co. (C. S. Newer, Supt., Carthage, N. C.) proposes extending from Cameron, N. C., southeast to Southport, on the Atlantic, a distance of [illegible] miles.

Ten Mile, Pa.—A charter has been granted to the Monongahela Coke R. R. Co. to build a railroad in Washington County from the Waynesburg R. R. to Ten-Mile village, 7½ miles long; capital, $[illegible]. M. C. Milholland, Pres., Pittsburg.

Kingsville, Tex.—E. W. [illegible] and other [illegible] of that city are reported to have taken [illegible] steps to build a railroad between Kingsville and San Antonio, a distance of about [illegible] miles. The proposed road will connect with the St. Louis, Brownsville & Mexico R. R. at this place.

Manchester, Vt.—Arrangements are reported to have been completed for the construction of a new railroad line between Manchester and Granville, N. Y. The new line will be about 25 miles long, and will connect at Manchester with the Rutland R. R., and at Granville with the Delaware & Hudson system. The road will be known as the Mettowee Valley R. R. The Mettowee Valley road will absorb the Manchester, Dorset & Granville R. R., and will continue the line from South Dorset to Granville. Casper L. Leach, Pres.

Pullman, W. Va.—It is stated that bids will be received until Aug. 15 by M. K. Duty, Pres. Lorama R. R., Pennsboro, W. Va., for building the road from Goose Neck to Pullman, W. Va., 5 miles.

Superior, Wis.—The Interstate Transfer Ry. Co., of Superior, is reported incorporated, to construct a railroad connecting Superior and Duluth, a distance of 20 miles; capital $500,000. Ft. Ontario, N. Y.—Bids will be received by Lieut. W. F. Harrell, Constr. Q. M., U. S. A., until Aug. 20 for construction of an iron and wire fence at this post, as advertised in The Engineering Record.

Cincinnati, O.—The lowest bid opened on July 18 by Lieut.-Col. Wm. T. Ressell, Corps. Engrs., U. S. A., for constructing dam at head of Brown's Island, Ohio River, was submitted by P. C. Turner, of Louisa, Ky., at the following bid. 165 cu. yds. excav., ledge rock, $3; 5,400 cu. yds., excav., loose material, $2.25; 90 lin. ft. anchor bolt holes, 60 cts.; 110 piles, ea. $10; 8,600 lbs. iron tie rods, anchor bolts, etc., 6 cts.; 2,000 cu. yds. stone 9 to 18 cu. ft., $6; 2,100 cu. yds. stone ¾ to 3 cu. ft., $3.50; earth fill (if required) per cu. yd., 75 cts.; 2,625 cu yds. concrete, $7; 40 bbls. extra cement, $2.25; total $52,130. John C. Thomas, of Belleview, O., bid for this work $56,815.

Cleveland, O.—It is stated that bids will be received until Aug. 6 by the Bd. Pub. Service (A. R. Callow, Secy.), for furnishing material and constructing a reinforced concrete culvert for Giddings Brook, under East Boule.

Cincinnati, O.—See "Water."

Panama.—Bids will be received by D. W. Ross, Genl. Purchasing Officer, Isthmian Canal Com., Washington, D. C., until Aug. 9 for furnishing cast iron pipe and fittings, gate valves, vitrified sewer pipe, electrical fixtures, gauge testing machine, steel, dipper arm for dipper dredge, repair parts for steam shovels, etc., as per circular 379; also until Aug. 12 for furnishing 3 steel barges, as per circular No. 380.

Philadelphia, Pa.—Bids will be received by Maj. J. C. Sanford, Corps. Engrs., U. S. A., Philadelphia, until Aug. 30 for constructing 2 steel, twin screw suction dredges for New York Harbor, N. Y. ,as advertised in The Engineering Record.

Block Island, R. I.—Bids will be received by Lieut. Col. J. H. Willard, Corps Engrs., U. S. A., Newport, until Aug. 28 for dredging entrance channel to Great Salt Pond, Block Island, as advertised in The Engineering Record.

McClellanville, S. C.—Bids will be received by Capt. E. R. Stuart, Corps Engrs., U. S. A., Charleston, until Aug. 20 for dredging canal, between Sewee Bay and McClellanville, as advertised in The Engineering Record.

Charleston, S. C.—The following are the bids opened on July 25 at the office of the Bureau of Yards and Docks, Navy Dept., Washington, D. C., for dredging Navy Yard, Charleston, S. C. (Specification No. 1545): (*a*) Price per cu. yd. for dredging, (*b*) total cost of removing cofferdam and sawing off sheet piling. Howard Trumbo, cor. Duval and Fleming Sts., Key West, Fla., *a* 18.49 cts, *b* $5,000; Roderick G. Ross, 204 East Bay St., Jacksonville, Fla., *a* 16 cts.; *b* $4,000; Coastwise Dredginfg Co., 810 Bank of Commerce Bldg., Norfolk, Va., *a* 22 cts., *b* $9,995; North American Dredging Co., 13-21 Park Row, New York, N. Y., *a* 14.9 cts., *b* $5,000, additional marl. dredging 60 cts. per cu yd.; Cataract Dredging Co., 701 Maryland Trust Bldg., Baltimore, Md., *a* 17⅜ cts., *b* $3,300.

The only bid received and opened on July 20 by Capt. G. P. Howell, Corps Engrs., U. S. A., for dredging Winyah Bay, S. C., about 175,000 cu. yds., was submitted by P. Sanford Ross, Inc., Jersey City, N. J., at 19.9 cts. per cu. yd.

Dallas, Tex.—The plans of J. E. Flanders, 354 Jackson St., are reported to have been adopted by the Park Board for an arch at the main entrance of the fair grounds; probable cost, $8,000.

Dallas, Tex.—See "New Industrial Plants."

Galveston, Tex.—Bids will be received by Capt. John C. Oakes, Corps Engrs., U. S. A., until Aug. 31 for jetty work at Galveston, as advertised in The Engineering Record.

Bremerton, Wash.—Bids were opened on July 27 at the office of the Bureau of Yards and Docks, Navy Dept., Washington, D .C., for Dry Dock No. 2, of concrete and granite at the Navy Yard, Puget Sound, Wash. (Specification 1542) and the following are the totals of bids received for work complete; certain deductions and modifications were presented by the first four bidders: Independent Asphalt Paving Co., Pioneer Bldg., Seattle, $1,240,000; Wm. Norton Concannon, 9 Mission St., San Francisco, Cal., $1,730,862; F. McLellan & Co., Inc., 435 Burke Blk., Seattle, $1,192,284; the Scofield Co., Pennsylvania Bldg., Philadelphia, Pa., $1,602,000, and the International Contract Co., N. Y. Block, Seattle, $1,594,140.

CURRENT NEWS SUPPLEMENT

AUGUST 10, 1907.

DIRECTORY OF NATIONAL TECHNICAL AND TRADE SOCIETIES.

American Society of Civil Engineers. Secretary, Charles Warren Hunt, 220 West 57th St., New York.

American Society of Mechanical Engineers. Secretary, Calvin W. Rice, 29 West 39th St., New York.

American Institute of Electrical Engineers. Secretary, Ralph W. Pope, 29 West 39th St., New York.

American Institute of Mining Engineers. Secretary, R. W. Raymond, 29 West 39th St., New York.

National Fire Protection Association. Secretary, W. H. Merrill, Jr., Chicago.

American Institute of Architects. Secretary, Glenn Brown, Washington D. C.

Association of Engineering Societies. Secretary, Frederick Brooks, 31 Milk St., Boston, Mass.

American Society of Heating and Ventilating Engineers. Secretary, W. M. Mackay, 113 Beekman St., New York.

Canadian Society of Civil Engineers. Secretary, Clement H. McLeod, 877 Dorchester St., Montreal.

Society for the Promotion of Engineering Education. Secretary, Prof. M. S. Ketchum, University of Colorado, Boulder, Colo.

American Society for Testing Materials. Secretary, Prof. Edgar Marburg, University of Pennsylvania, Philadelphia, Pa.

American Society of Municipal Improvements. Secretary, George W. Tillson, Room 12, Municipal Building, Brooklyn, N. Y.

Association of Railway Superintendents of Bridges and Buildings. Secretary, S. F. Patterson, Concord, N. H.

American Railway Engineering and Maintenance of Way Association. Secretary, E. H. Fritch, 962 Monadnock Block, Chicago.

American Water Works Association. Secretary, J. M. Diven, Charleston, S. C.

American Street and Interurban Railway Association. Secretary, Bernard V. Swenson, 29 West 39th St., New York.

American Foundrymen's Association. Secretary, Richard Moldenke, P. O. Box 432, New York.

Engine Builders' Association of the United States. Secretary, J. L. Lyle, 39 Cortlandt St., New York.

American Public Works Association. Secretary, W. H. Flint, Chattanooga.

Association of American Portland Cement Manufacturers. President, J. B. Lober, 1232 Land Title Building, Philadelphia.

National Association of Cement Users. President, Richard L. Humphrey, Harrison Building, Philadelphia.

American Society of Refrigerating Engineers. Secretary, H. W. Ross, Room 806, 258 Broadway, New York.

American Public Health Association. Secretary, Dr. C. O. Probst, Columbus, O.

THE BOSTON DRY-DOCK CASE.

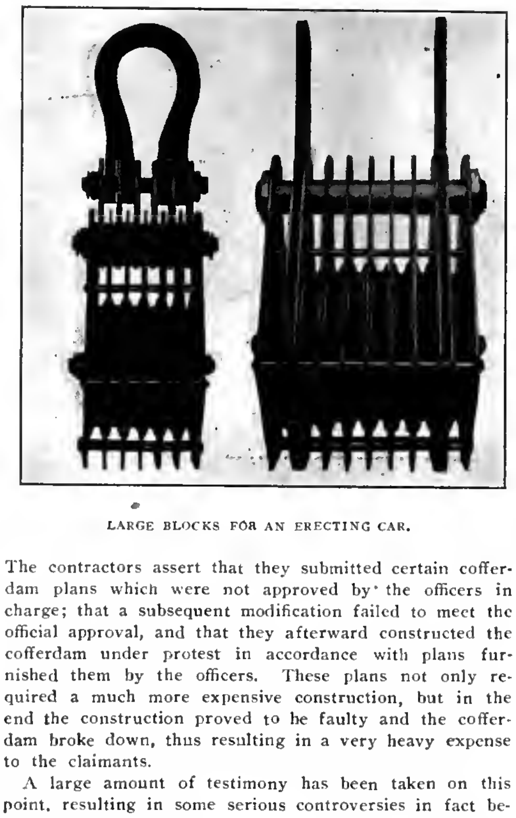
The taking of testimony has now been concluded in the claim against the United States arising out of the construction of the Boston Dry Dock, which has been before the Court of Claims since February, 1905, and the briefs of counsel will soon be prepared. The case is one of very general interest to the engineering profession. O'Brien & Sheehan were the original contractors for this dock, the contract bearing date of March 14, 1899. They continued work for over three years under it, when their financial difficulties required the work to be taken up under a supplementary contract by the City Trust, Safe Deposit & Surety Co., of Philadelphia. They continued the work at a very large loss until the year 1905, when the company went into the hands of a receiver. The work was completed by J. Hampton Moore as receiver, who now appears as claimant in the Court of Claims.

The total amount claimed is $592,522.95. The largest single item is over a quarter of a million dollars, arising out of the delay in the inspection of the stone entering into the work. The two other chief items arise out of a change of plan claimed to have been made after the work was in progress, and out of the plan used in the construction of the cofferdam.

A large amount of evidence has been taken to show that the inspection of the stone was unnecessarily delayed. If that question of fact can be settled in favor of the contractors, the question of law will have to be determined as to the measure of damages for the delay. It appears that during the period of delay an enormous rise occurred in the price of stone. The claimants take the position that the rule for fixing the damages permits the rise in prices to be considered as a natural consequence of delay. In support of this, a number of past decisions of the Court of Claims are cited.

The claim upon the substitution of plans asserts that a plan known as plan D, was the approved plan upon which they contracted to build. This was a modification of two previous plans of different dimensions and it conformed to the dimensions of the lesser plan, the claimant asserts. The contractors worked on this theory for two years, when they were officially informed that the dimensions in plan D were erroneous and should have conformed to the dimensions of the larger plan originally submitted. This increased the amount of excavation and the quantity of concrete, resulting in an increase of cost of about $50,000. The contractors maintain that the correctness of their original position was clearly shown by contemporary construction during the two years when they were building according to the lesser dimensions. They rely upon the doctrine declared by the Supreme Court of the United States that the immediate practical construction of a contract by two parties settles the true meaning of uncertain provisions.

The third claim, based upon the construction of the cofferdam, presents very complicated questions of fact.



LARGE BLOCKS FOR AN ERECTING CAR.

The contractors assert that they submitted certain cofferdam plans which were not approved by the officers in charge; that a subsequent modification failed to meet the official approval, and that they afterward constructed the cofferdam under protest in accordance with plans furnished them by the officers. These plans not only required a much more expensive construction, but in the end the construction proved to be faulty and the cofferdam broke down, thus resulting in a very heavy expense to the claimants.

A large amount of testimony has been taken on this point, resulting in some serious controversies in fact between the witnesses.

It is hoped that the case may be brought to a hearing in the Court of Claims during the coming term. The receiver is represented by Messrs. George A. & William B. King, of Washington, D. C., and the interests of the United States are looked after by Mr. P. M. Ashford, one of the assistants to the Attorney-General in the Department of Justice.

LARGE BLOCKS FOR AN ERECTING CAR.

The Lucius Engineering & Contracting Co. is now building two 60-ton derrick cars for use in the construction of the Harlem River branch of the New York, New Haven & Hartford R. R. Each car will have three six-sheave blocks and one eight-sheave block. The latter is used at the top of the mast of the car, and its six inside sheaves will be used as a six-sheave block, one outside sheave will take the lead line from the top lift, and the other outside sheave the lead line from the falls. By using an eight-sheave block in this way it is possible to do away with the two lead-line sheaves generally placed at the top of the mast.

The eight-sheave block is 5½ ft. high and weighs 2,650 lb. It has a 5-in. head bolt and sheaves 24 in. in diameter, with phosphor-bronze bushed grooves for a ⅞-in. cable. The block is attached to the mast by a 5-in. pin, which goes in holes drilled in two 10x1-in. straps.

The six-sheave blocks are 6 ft. 10 in. high and weigh 2,160 lb. The shackle is 4 in. in diameter and the shackle bolt, head-bolt and sheave pin are 3 in. in diameter. The hanger straps are ⅞x8 in. The sheaves are 24 in. in diameter and have phosphor-bronze bushings for a ⅞-in. cable. The plates are ⅜ in. thick, and there are two 1½x7-in. straps. These blocks have been made by the W. W. Patterson Co., of Pittsburg, Pa.

TRADE PUBLICATIONS.

The Buffalo Forge Co., of Buffalo, N. Y., has recently issued a folder concerning improved types of planing mill exhausters, dust separators and volume blowers and exhausters. The leaflet gives dimensions and a price list of the apparatus in the various sizes.

The Kinnear Mfg. Co., Columbus, Ohio, has recently issued two attractive booklets, one on car barn doors and the other on wood rolling doors for round houses. The company has had extensive experience in the installation of rolling doors for electric railway car barns and has perfected an arrangement for automatically closing the gap in the trolley wire when the door is raised, and also for the rapid operation of the doors by electric motors. In steam railroad round houses, where sulphurous fumes in the smoke from the locomotives is liable to prove destructive to steel work, there has arisen a demand for rolling doors of wooden construction; this has recently been met by this company by a new design of wooden rolling door that is non-corrosive, water and weather proof and easy to operate.

The Jeffrey Mfg. Co., Columbus, Ohio, has issued an illustrated supplement to its general catalogue of Jeffrey conveying machinery for saw mills, lumber mills and wood working industries. In it are illustrated many installations of Jeffrey log hauls, log conveyors, chain refuse conveyors, sawdust conveyors and other apparatus for rapidly handling materials and refuse in saw mills and wood working plants.

Alberger cooling towers are described in a new catalog of the Alberger Condenser Co., New York. It contains a detailed explanation of the purpose of the cooling tower for use with condensing steam engines and turbines and also for refrigerating plants. The tower is described in both the natural and artificial draft forms and favorable arrangements of apparatus are suggested for power plant installations.

The Emerson Steam Pump Co., Alexandria, Va., have recently issued a 20-page booklet of testimonials from parties who have used its pumping apparatus.

The Robins Conveying Belt Co., New York, has just issued a leaflet describing the installation of a package conveyor system in the new store of B. Altman & Co., Fifth Ave., New York. It illustrates the general layout of the belt and the central discharging point where the packages are received. There are three conveyors 30 in. in width, 71, 91 and 191 ft. in length, respectively, and there is one large flat belt, 36 in. wide and 75 ft. long, guarded by skirt boards designed for carrying unwrapped packages. The belts are driven by electric motors through worm reduction gears.

Booklet 20A, recently issued by the Ingersoll-Rand Co., New York City, describes the new Temple-Ingersoll electric air drill. This drill solves the problem of employing electric current in driving rock drills. The drill is air-operated, with special advantages of its own, especially in increased force of the blow struck and saving of power.

The Strang Gas-Electric Car Co., New York, has issued a pamphlet describing a system of motor-car propulsion having a six-cylinder gasoline engine which drives a generator, with storage battery auxiliary, furnishing current to electric railway motors driving the car in the usual way. An account is given of trials made of cars already built, together with results in operation on a number of lines. Several motor cars of this system are under construction for the Chicago & Alton and other lines.

The details of the standard heavy-duty Twin City Corliss engine are fully illustrated and described in Catalogue 101, issued by the Minneapolis Steel & Machinery Co., Minneapolis, Minn. The engine is illustrated in all details from bed frame to valve gear, the latter

being shown in two forms, one for ordinary speeds and the other for high speeds. Typical installations of the engine for use in a number of different classes of service, are also illustrated.

The Falk Co., Milwaukee, Wis., has issued a 92-page, 8x10-in. pamphlet descriptive of its products. A large section is devoted to the steel department, a specialty being made of open-hearth steel castings. This department is outlined in detail from pattern shop to foundry floor and a large number of particularly difficult castings are illustrated. A department is maintained for gears and pinions, another for special track work for street railways, while a third is devoted to the Falls cast-welded rail joint for street railways, all of which are fully described.

The Universal Form Co., 122 Centre St., New York, has issued a catalogue describing a form of wood framing covered on one side with sheet steel, and made in various sizes, that adopted as the standard unit being 3 ft. square. Auxiliary units and corners enable the forms to be used for columns, floorbeams and slabs, belt courses and similar combinations of inside and outside corners. The units are fastened together by dowels in the metal corners, and by a dished washer which fits over the corners.

Different styles of interlocking steel sheeting are described in a bulletin issued by the National Interlocking Steel Sheeting Co., Chicago. Eleven styles adapted to various classes of work are illustrated, and accompanied with data regarding their sires and weights.

The Trussed Concrete Steel Co., of Detroit, Mich., has issued a large sheet containing illustrations of its new type of expanded metal for reinforcing concrete. This sheet contains also tables giving the strength of the expanded metal of different numbers, and the strength of slabs of various spans and thicknesses reinforced with it.

A handbook relating to the design, selection and use of steam and power-driven air compressors of many types, from small plants for a few drills, to large machines where the maximum economy is desired, has recently been issued by the Sullivan Machinery Co., Chicago. The machines themselves are described in detail and elaborate tables of their dimensions and capacities are given. The book also contains a large amount of useful information concerning the selection of auxiliary apparatus, and numerous tables of value to designers of compressed air plants.

The Universal system of machine moulding of Ph. Bonvillain and E. Ronceray, 9 Rue des Envierges, Paris, is described in detail in a catalogue in English recently issued. This system is a departure from the usual machine moulding with pattern plates. Both cylindrical and complicated cores can be molded in this machine, and the pamphlet shows work done for complicate automobile engine cylinders and crank cases, stove parts and sanitary castings.

Recent bulletins from the General Electric Co. describe the new line of Form P belt-driven alternators that have recently been placed on the market; new designs of switchboard panels for series arc or incandescent lighting from constant-current transformers; the Edison "Gem" high-efficiency incandescent units with bowl holophane reflectors and the new security "snap" sockets for incandescent lamps. The Form P alternators are compact machines built in sizes from 30 to 200 kw. at 2,300 volts in single, two or three-phase, and specially adapted for factory lighting and small plants. The new socket is an improvement over the former style in that the shell is attached to the base by spring catches that snap into place instead of the usual screws. A valuable wiring table has also been issued giving an approximate rule for sizes of wires for three-phase transmission lines for voltages from 2,000 to 30,000.

The Joyce-Cridland Co., Dayton, O., has issued an eight-page folder describing several types of lifting jacks for stone yards and quarries.

Direct current motors and generators manufactured by the Barriett Electric Mfg. Co., Cincinnati, O., are illustrated in a recent pamphlet. The machines are of the protected and the semi and fully enclosed types.

The Buckeye Traction Ditcher Co., Findlay, O., has issued two pamphlets illustrating trench excavating machines for heavy and light work, respectively. The lighter machines are adapted for digging tile drain trenches, and the pamphlet devoted to them discusses farm drainage.

The care of electric mine locomotives in service is explained in a bulletin recently issued by The Jeffrey Manufacturing Co., Columbus, O. It is an eighty-page, well-illustrated book, and contains much valuable information concerning the operation and repair of such locomotives.

Crushing and road machinery manufactured by the Climax Road Machine Co., Marathon, N. Y., is described in a pamphlet recently issued by that company. Portable machinery of practically every kind necessary for stone crushing and road making is illustrated. The company also builds highway bridges.

The Carbolineum Wood Preserving Co., New York City, has issued a pamphlet describing "carbolineum," a preservative which is applied to the surface of wood with a paint brush. Letters are given from those who have used the preparation.

The construction of concrete sewers with collapsible steel centering is described in a 67-page book recently issued by the Blaw Collapsible Steel Centering Co., Pittsburg, Pa. There are excellent illustrations showing steel forms for sewers of various shapes. Two chapters discuss the design of concrete sewers and the use of concrete in sewer construction, and a set of specifications for concrete sewers is given.

M. de Frise's system of water sterilization by the use of ozone is described and compared with purification by filtration, in a pamphlet recently issued by M. de Frise, 38 Rue du Louvre, Paris, France. Briefly, the process consists in passing ozonized air bubbles through the water, the ozone being generated electrically. A large experimental plant is in operation at the municipal water-works of Paris at Saint-Maur and records of analyses of the effluent from it are given.

Hydraulic machinery for the manufacture of concrete stone is illustrated in Catalogue E, recently issued by the Fisher Hydraulic Stone & Machinery Co., Baltimore, Md. Methods of building and structures built of hydraulic pressed concrete stone are also illustrated.

The Portland Cement Co., Denver, Colo., has issued a booklet describing the manufacture and properties of Ideal Colorado Portland cement and giving instructions for its use for a variety of purposes. Structures in which Ideal Colorado cement was used are illustrated.

Sanitary metal factory equipment and specialties are described in a pamphlet recently issued by the Manufacturing Equipment & Engineering Co., Boston, Mass., which manufactures individual wash-bowls, arranged in single or double batteries of any number, all-metal lockers, soda and potash kettles, shop and factory stools, work benches for all requirements, bench drawers with rolling bearing slides, storage racks, transporting racks and emergency hospital equipment. The sanitary wash-bowls have separate supply and waste, and the lockers are of a circular type, with doors of small dimensions which furnish ample access to the interior and still do not obstruct the corridors.

Bulletin 143 of the B. F. Sturtevant Co. describes electrical generating sets with simple horizontal engines. Details of both the generator and engine construction are shown, together with principal dimensions of the direct-connected units for a great many capacities from 6 to 75 kw.

The Canton-Hughes Pump Co., Canton, Ohio, has issued a pamphlet descriptive of the line of pumping machinery which it manufactures. The details of the steam cylinders and valves are shown and illustrations of pumps in all sizes and for all services are illustrated, from small duplex pumps for oil to high-duty pumping engines for water-works service. A specialty is made of high-pressure pumps, pumps for handling tar and heavy liquids and also condensing apparatus.

The C. W. Hunt Co., New York, has published an introduction to the general line of machinery manufactured by this company for the handling of coal. The apparatus referred to includes steeple towers, parabolic boom towers, overhead bridges, elevators and conveyors and the machinery and tackle necessary for their operation.

A new rock drill catalog has just been issued by the Chicago Pneumatic Tool Co., Chicago, Ill., devoted to the Chicago Giant rock drills and kindred appliances. Special attention is called to the method of lubrication, which is a distinguishing feature of this drill. Several pages are devoted to rock drill steels, and also to the Franklin air compressors.

The Standard Concrete-Steel Co. has issued a series of 8x13-in. bond paper prints illustrating the details of the Guy B. Waite systems of fireproof floor arches. These systems have been approved by the Bureau of Buildings of New York City, and the paper prints are supplied to users of the systems to be filed with the Bureau in accordance with its requirements.

Fire brick, of various grades, shapes and sizes, are described in a pamphlet recently issued by the Garden City Sand Co., Chicago, Ill. There are suggestions on furnace construction and fire brick requirements.

Steel standpipes, water towers, storage tanks and smoke-stacks, built by Messrs. Tippett & Wood, Philipsburg, N. J., are illustrated in a 32-page pamphlet recently issued. Tables showing the capacity of various tanks per foot of depth, the pressure of water for different depths and the properties of fire streams, are given.

Catalog 268, recently issued by the Studebaker Bros. Mfg. Co., South Bend, Ind., describes dump wagons and carts, street sweeping machines, sprinkling wagons and hand carts made by that company. Several pages are devoted to a description and illustration of a new contractor's bottom dumping wagon which has just been put on the market.

The Portland Cement Company of Utah, Ltd., Salt Lake City, has issued a handsome 114-page book illustrating a great variety of structures in which its Red Diamond brand of cement has been used and giving a brief account of the development of the Portland cement industry.

Bulletin W-29, issued by the Ferro-Concrete Construction Co., Cincinnati, O., contains illustrations of buildings erected by that company and points out the special features of each structure.

Record 61, recently issued by the Baldwin Locomotive Works, has for its subject "The Steam Locomotives of the Future," an article by Lawford H. Fry. It is a discussion of the present state of steam locomotive development, with a forecast of possible tendencies of development in the future. The effects of the enormous growth of railway traffic upon locomotive development are outlined and the advantages derived from various improvements in locomotive construction referred to. Among the illustrations are views of the large Mallet articulated compounds recently built in this country.

Abrasive machinery for use in the marble industry is explained in a well-prepared 50-page catalog recently issued by the Royden Marble Machinery Co., New York City. The advantages of the carborundum process of handling the marble from the gang saws is discussed and the various machines used in this connection described. These include the drum rubber, the turning head coper, the gang coper, the cut-off coper and other special machinery, including moulders and marble lathes. This company also makes a specialty of mosaic machines for the method of laying from spools, and floor polishing machinery. The catalog concludes with an article on abrasives with special reference to their use in connection with the finishing of marble, slate and soft stones.

A method of securing nailing strips to concrete floors, devised by Mr. W. B. Ruddick, 400 East 165th St., New York City, and used in the Singer Sewing Machine Building, Elizabethport, N. J., is described in a folder recently issued by him. Wire clips are inserted in the fresh concrete by a special device with which several clips can be placed at once. The portion of the wire projecting above the floor surface is bent over near its end at such a height that the bent end can be driven into the side of the nailing strip. The clips are placed on both sides of each strip.

Reinforced concrete mills and factories built according to the Kahn system are described in a handsome 32-page pamphlet recently issued by the Trussed Concrete Steel Co., Detroit, Mich. Another pamphlet issued by the same company discusses reinforced concrete in general and presents the principles and advantages of the Kahn trussed bar.

BUSINESS NOTES.

The H. W. Johns-Manville Co., 100 William St., New York, has completed arrangements for the exclusive sale of the "Magic" boiler compound. This has been on the market for some time but is comparatively unknown, as it has never been pushed. A folder describing its purpose and method of use has just been issued by the company.

The steel buildings for the machine shop and foundry of the Bartlesville Foundry & Machine Works, Bartlesville, I. T., will be built by the Southwestern Bridge Co., Joplin, Mo. The latter company has also been awarded a contract for a 50,000-gal. tank and tower for Sayre, Okla.

The Atlantic Coast Line Ry. Co. has installed at the South Rocky Mount plant a 5-ton, 72-ft. span, 3-motor electric traveling crane built by the Northern Engineering Works, Detroit.

The Parker Boiler Co., Philadelphia, has received the following orders: Austin Manufacturing Co., Harvey, Ill., one 365-h.p. boiler; Southern Indiana Hospital for the Insane, Evansville, Ind., three 300-h.p. boilers; Perth Amboy Chemical Co., Perth Amboy, N. J., one 267-h.p. boiler.

Among recent sales of electric generating sets the B. F. Sturtevant Co., Boston, Mass., report the following: Electric Construction Co., Richmond, Va.; McCann Ice Plant, Philadelphia, Pa.; Bethlehem Brewing Co.; New Bethlehem, Pa.; Smith & Hammond Lumber Steamers; Eberhard Faber Pencil Co., Brooklyn, N. Y.; Metric Metal Works, Erie, Pa.; Hanover National Bank Bldg., New York City; Sedalia Ice, Lt. & Fuel Co., Sedalia, Mo.; H. J. Kunzig, Philadelphia, Pa., and Board of Water Supply, New York City.

The New York State Steel Co., Buffalo, N. Y., has placed a second order for a 4,000-h.-p. We-Fu-Go water softening and purifying system with the Wm. B. Scaife & Sons Co. Other sales of Scaife and We-Fu-Go systems are reported as follows: The Andrews Steel Co., Newport, Ky., 3,750 h.-p.; National Home for Disaled Volunteer Soldiers, Dayton, O., one 300,000 gal. per 24-hour system, two 1,200 gal. per hour system; American Sheet & Tin Plate Co., Pittsburgh, Pa., 5,000 h.-p.; Rochester & Pittsburgh Coal & Iron Co., DeLancey, Pa., 1,500 h.-p. (2nd contract); Youngstown Sheet & Tube Co., Youngstown, O., 15,000 h.-p.; Pennsylvania Salt Mfg. Co., Natrona, Pa., 5,000 h.-p. (2nd contract); Norwalk Iron & Steel Co., Norwalk, O., 1,000 h.-p.; McConway & Torley Co., Pittsburgh, Pa., 1,000 h.-p.

The Power Specialty Co., New York, manufacturers of Foster superheaters, have made arrangements for the exclusive selling rights in the United States, Canada and Mexico of Duval metal packing. A complete stock of the packing in standard sizes will be kept on hand in order to fill orders promptly.

The Sandusky Portland Cement Co., Sandusky, O., has been compelled to quadruple its capacity for making its Medusa waterproof compound for concrete. It has been employed lately on the important buildings of the Metallic Casket Co., Springfield, O.; the Brandenstein buildings, San Francisco; the Mechanics and West Bank, San Francisco; the Delger Bldg., San Francisco; the Proctor & Gamble soap works, New York; the Packard garage, New York; Pugh printing building, Cincinnati, and Bostwick-Braun warehouse, Toledo.

The forty-fifth annual picnic of the Lunkenheimer Co., Cincinnati, one of the important events in the social side of the industrial affairs of the city, was held on July 27. Three special trains of 15 cars each took the people to a park about 25 miles from the city, where the company provided a vaudeville entertainment, a large band, an orchestra and prizes for various events. The employees and their families during these picnics are the guests of the company from the time they leave the city until they return, and are under no expense whatever.

The Foundation Co,. New York, has been awarded a contract for sinking a 21x17-ft. mine shaft through about 70 ft. of water-bearing material on the Swarzy Range, near Isheming, Mich. The company will also put in the foundations for the new Lawyer's Title Insurance & Trust Co. building at 160-164 Broadway, New York.

The Northern Engineering Works, Detroit, has recently supplied electric cranes to the Toledo Gas & Electric Co.; Murphy Power Plant, Detroit; and the Georgia Marble Finishing Works, Canton, Ga.

IMPORTANT HEARING ON REINFORCED CONCRETE.

Attention is particularly called to a public hearing that will be held at 3 p. m., Aug. 14, in the Aldermanic Chamber of the New York City Hall by the Reinforced Concrete Committee of the Municipal Building Code Revision Commission. Engineers and contractors interested in reinforced concrete construction will be given an opportunity to present their views concerning regulations relating to the subject, and the Committee will be pleased to receive these in the form of briefs, in triplicate. The present regulations of the Borough of Manhattan will be used as a basis of discussion.

It is needless to point out that this hearing is of the highest importance to those interested as designers of reinforced concrete works or contractors for their execution. The Committee, of which Mr. Rudolph P. Miller is chairman, may reasonably be expected to present a report which will set forth the best conservative practice, and it deserves to have the hearty assistance of all who are interested in preventing poor design and careless construction. A recent decision of the New York courts makes the mere fact of collapse of forms used in reinforced concrete buildings a prima facie proof of negligence on the part of the contractor, rendering him liable for all resulting injuries, but even this drastic judicial ruling will not be so useful as clear building regulations which permit all good design and construction while barring out everything that is unsafe. The formulation of such regulations is a difficult task, however, and the Committee accordingly deserves all the support engineers and contractors can give it.

A NEW TRACTION STEAM SHOVEL.

The accompanying illustration gives a fair idea of a traction steam shovel made by the Avery Mfg. Co., Peoria, Ill. It has been developed from its new under-mounted engine, which is a result of studies made to strengthen such engines in order to furnish the maximum resistance to the heavy strains arising in construction work. The main purpose of traction engines until recently has been to run threshing machinery, a service which did not develop the same kind of stresses that arise in heavy hauling. Accordingly the boiler, which is an important element in the frame of the older type of traction engine, began to show signs of inability to resist the hard service incident to hauling constantly, and for the latter service the company has developed a machine in which the cylinders are mounted on an independent steel frame and the boiler is entirely relieved of other strains than those due to raising steam. In addition to this fundamental change, the company introduced a number in some of the details, such as a screw shaft guide which eliminates the slackness of the chain guide, or, if desired a steam guide.

The steam shovel with which this engine can be equipped is rated at 1 to 5 cu. yd. of dirt per minute, according to the character of the material, and it can also be used for loading ore, sand and gravel into wagons and cars. By removing the shovel, the lifting crane can be used for unloading heavy material from flat cars or loading them, and for picking up and transporting heavy articles.

The tender used with the engine is heavily built and carried by an 18-in. faced wheel. It is attached to the engine and guided in such a way that it is always directly in line, whether moving forward or backing up. It has a water capacity of about one ton.

A NEW TRACTION STEAM SHOVEL.

PERSONAL NOTES.

Mr. V. D. Cockey has been appointed an assistant engineer in the service of the Baltimore Sewerage Commission.

Mr. Heiskell Weatherford has been elected city engineer of Memphis, Tenn., succeeding Mr. James A. Amberg, resigned.

Mr. G. P. De Wolf has been appointed assistant chief engineer of the Mexican International Ry., with offices at Ciudad Porfirio Diaz, Coahuila, Mexico.

Mr. E. B. Carter, for a number of years general roadmaster of the Florida East Coast Ry, has resigned to become connected with the U. J. White Co., of Dupont, Fla.

Mr. A. R. Hirst, until recently assistant engineer in the Highway Division of the Maryland Geological Survey, has been appointed State Highway Engineer of Wisconsin.

Mr. W. D. Wheeler has been promoted to fill the position of chief engineer of the Minneapolis & St. Louis R. R., left vacant by the resignation a few weeks ago of Mr. H. G. Kelley.

Mr. O. Rickert, division engineer of the Baltimore & Ohio R. R. at Grafton, W. Va., has resigned to become engineer of maintenance of way on the Missouri Pacific Ry. System.

Mr. Arthur K. Cox, of Iowa City, Ia., has established an annual prize of $100 for the best graduation thesis in the College of Engineering of Iowa University, from which he was graduated.

The Engineers' Club of Central Pennsylvania made an excursion, Aug. 3, to Minqua, Pa., to inspect the hydro-electric power development of the McCall's Ferry Power Co., on the Susquehanna River.

Lieut.-Col. John Millis, Corps of Engineers, U. S. A., in charge of all fortification construction in the Philippine Islands, has been granted three months' leave of absence. He will return to the United States by way of the Suez Canal.

Mr. E. J. Molera, consulting civil and electrical engineering and architect and president of the Academy of Sciences, San Francisco, has been appointed a member of the Board of Supervisors of San Francisco by the newly elected Mayor, Dr. Edward R. Taylor.

Mr. W. J. Bergen, assistant engineer of The New York, Chicago & St. Louis R. R., at Cleveland, O., has been appointed assistant to the chief engineer, Mr. E. E. Hart. Mr. C. B. Hoyt will succeed Mr. Bergen as superintendent of track maintenance and construction.

John T. Brady, president of the well-known building contracting firm of John T. Brady & Co., New York City, died of paralysis in that city Aug. 5, aged 55 years. Since he was first struck by paralysis, seven years ago, he had not been actively engaged in business.

Mr. Frederic C. Dunlap, chief of the Bureau of Filtration of Philadelphia, has been made chief of the Bureau of Water of that city, succeeding Mr. Frank L. Hand, who resigned some time ago, and the Bureau of Filtration has been abolished, its work being taken up by the Bureau of Water.

Mr. J. F. Hasskarl, principal assistant to Maj. James C. Sanford, Corps of Engineers, U. S. A., in charge of improvements on the Delaware River, has been appointed assistant director of the Department of Wharves, Docks and Ferries of Philadelphia, under Mr. John C. Grady, whose appointment as director of that department was mentioned recently in these columns.

The Connecticut Society of Civil Engineers will make a trip of inspection of engineering work in the Naugatuck Valley, Aug. 14. Among the works viewed will be an electric railway involving very heavy work, the sewage filtration plant and sewage experiment station of Waterbury, and railroad grade abolition and station construction in the same city. Messrs. D. S. Brinsmade and J. F. Jackson, New Haven, are president and secretary, respectively.

Mr. Tinius Olson, of Tinius Olson & Co., testing machine makers, Philadelphia, Pa., recently was made a Knight of the Order of St. Olavs by King Haakon, of Norway. The order, of which the king is head, is composed of natives of Norway who have won fame in letters, law, theology, science and invention. The decoration was conferred on Mr. Olson for his studies of metals and his inventions of machines for their investigation.

CONTRACTING NEWS

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS, ENGINEERS AND MANUFACTURERS
ENGINEERING AND BUILDING SUPPLIES

WATER.

Notes Arranged Alphabetically by States.

Fruita, Colo.—The citizens are reported to have voted to issue $25,000 bonds for the construction of a reservoir, and the installation of a mountain water system.

Sterling, Colo.—The directors of the North Sterling Irrigation Dist. are reported to have voted to issue bonds to the amount of $1,400,000 for the construction of the Glendale and Point of Rock reservoirs, with inlet and outlet ditches. The district comprises about 70,000 acres of land.

**Molina, Colo.*—I. A. Kirkendall, Secy. Cottonwood Lakes Reservoir Co., writes that the contract for constructing cement concrete box at headgate No. 1 Lake (bids opened July 25), has been awarded to Miller & Sieg, of Molina, for $1,975.

New Haven, Conn.—The New Haven Water Co. is reported to have decided to build on Mill Rock, Hamden, a stand-pipe or water tower of about 400,000 gal. capacity, to supply the Prospect Hill Dist. of the 9th Ward.

Bradentown, Fla.—It is stated that bids will be received until Aug. 14, by the Bd. Bond Trus., (A. J. Beck, Secy.) for boring a well and laying pipe. Wm. W. Lyon, Engr., Palatka.

Ft. Dade, Fla.—Bids will be received by Lieut. J. A. Thomas, Constr. Qm., U. S. A., until Aug. 30, for constructing a 150,000 gal. steel tank and trestle and ice plant at this post, as advertised in The Engineering Record.

Atlanta, Ga.—R. M. Clayton, City Engr., is reported to have completed surveying and measuring the new reservoir at Hemphill station.

Rome, Ga.—We are informed that bids will probably be called for in about 60 days for water works improvements, to cost $50,000, and sewers to cost $25,000. Engineer, J. N. Hazlehurst, of Atlanta. C. E. McLin, Pres. Bd. Pub. Wks.

Herrin, Ill.—Paul D. Herrin, Cashier of the City National Bank, is reported to have petitioned for a franchise for water works.

Geneseo, Ill.—Alvord & Burdick, 1207 Hartford Bldg., Chicago, has prepared specifications for an addition to the pumping facilities of the City Water Works, the estimated cost of which is about $5,100, including a gasoline engine, triplex pump outfit and an addition to the pumping station. Bids for pumping machinery will be received until Aug. 19, specifications may be procured by application to J. F. Liebknecht, City Clk.

Milltown, Ind.—The Town Board is reported to have granted W. H. Rose, of Corydon, a franchise for water works.

Primghar, Ia.—M. Tschirgi & Son, of Dubuque, are preparing plans for water works to cost about $10,000. W. H. Downing, City Clk.

Louisville, Ky.—It is stated that bids will be received by the Bd. of Pub. Wks. until Aug. 20 for furnishing and erecting 29 fire hydrants. Jos. P. Claybrook, Ch. Engr.

[illegible], Ia.—The O'Neil Eng. Co., of Dallas, Tex., is reported to have completed plans for water works; [illegible] $25,000.

[illegible], Me.—W. I. Brown, Clk. Water Bd., writes [illegible] opened on Aug. 1 for the construction of a sedimentation basin for the City of Bangor. New bids will probably soon be received. The work includes head house, a covered reinforced concrete basin of a total capacity of 1,500,000 gals. in two compartments, complete, with all excavation and embankments and piping with the basin and walls. Engr., Geo. W. Fuller, 170 Bway., New York, N. Y.

Cumberland, Md.—Bids will be received by the Bd. of Water Comrs. until Aug. 26 for furnishing and installing complete a pumping engine of 5,000,000 gal. capacity, as advertised in The Engineering Record.

Westborough, Mass.—Bids will be received until Aug. 23 by the Trus. of the Westborough Insane Hospital at the office of Geo. S. Adams, M. D., Supt., for laying about 3,880 ft. 12-in. c. i. water pipe from 9 to 13 ft. deep, approximately, and other work pertaining thereto. J. J. Van Valkenburgh, Engr., South Framingham.

Fitchburg, Mass.—Walter A. Davis, City Clk., writes that no new work is contemplated in connection with $80,000 water loan recently passed by Council. The work is almost complete. Thos. C. Lovell, Supt. Water Wks. David A. Hartwell, City Engr.

Cloquet, Minn.—The citizens are reported to have voted July 30 to issue $50,000 bonds to complete the water works.

**Hastings, Minn.*—The Des Moines Bridge & Iron Co. of Des Moines, Ia., is reported to have secured contracts for constructing water works at $38,350 and a sewerage system at $31,125.

Dawson, Minn.—See "Power Plants, Gas and Electricity."

St. Paul, Minn.—We are informed that no bids were received on July 20 by Capt. Edw. H. Schulz, Corps. Engrs., U. S. A., P. O. Box 654, St. Paul, for the reconstruction of Sandy Lake Reservoir Dam.

New York, N. Y.—The following are the bids opened on Aug. 6 by the Bd. of Water Supply, N. Y. City, for the construction of the main dams for Ashokan reservoir near Brown Station in the towns of Olive and Marbletown, Ulster County: (*a*) Stewart, Kerbaugh, Shanley Co., $13,979,813; (*b*) O'Rourke Eng. Constr. Co., $14,707,750; (*c*) John Pierce Co., $10,315,350; (*d*) MacArthur Bros. Co. & Winston Co., $12,669,775; (*e*) Bradley Contr. Co., $13,931,250 (bidders all of N. Y. City).

950 M ft. lumber	65.00	75.00	40.00	50.00	60.00

Kansas City, Mo.—Bids will be received until Sept. 3 by the Bd. Pub. Wks., Everett Elliott, Secy., for furnishing and delivering f. o. b. cars Kansas City, the following: 50 tons 4-in., 1,110 tons 6-in., 260 tons 8-in., 370 tons 10-in., 220 tons 12-in., 700 tons 16-in., and 20 tons each of 20, 24, 30, 36 and 42-in. c. i. pipe, also 2,200 tons 48-in. c. i. pipe and 50 tons special castings for pipe 24-in. and greater in diam.; also same time and place for 1,000 lin. ft. riveted steel pipe, having a minimum internal diam. of 48-in., made of soft steel plate ½ in. thick; bids will also be received for furnishing 6,000 lin. ft. additional 48-in. steel riveted pipe.

Bradshaw, Neb.—C. B. Palmer, Jr., Village Clk., writes that bids for the proposed water works will be opened on Aug. 30.

Jersey City, N. J.—Bids will be received until Aug. 28, by the Mayor and Council for $95,000 water bonds. Jas. H. Londrigan, City Clk.

North Wildwood, N. J.—The Wildwood Water Co. is reported incorporated to operate water works in the Borough of North Wildwood; capital $100,000. Incorporators, H. H. Hoffman, Chas. F. Sanders, Edmund Wratherby, of Wildwood, N. J.

Hudson, N. Y.—The citizens are reported to have voted on July 29 to issue $15,000 bonds to lay out new street and provide adequate water and sewer facilities on Secon Hill.

**Rochester, N. Y.*—Ripton & Murphy are reported to have on July 31 secured contract for new water mains in 10th, 12th, 13th, 17th and 22d Wards, for about $10,645.

Martinsburg, N. Y.—C. F. Pitcher, Town Clk. writes that contract has been let for water works, recently reported.

Honeoye Falls, N. Y.—The Village Trus. are reported to have selected W. J. White, of Buffalo, to make complete survey for water works and a sewerage system.

Geneva, N. Y.—The Bd. of Pub. Wks. is reported to have decided to ask City Council to appropriate $10,000, with which to enlarge water mains, which bring the water from storage ponds to city.

Rochester, N. Y.—Water and local improvement bonds to the amount of $640,000 are reported sold.

**Buffalo, N. Y.*—The following are reported to be the bids opened on July 8 by F. G. Ward, Comr. Pub. Wks., for building foundations for new water works pumping station, on lands bet. Jersey St., Porter Ave., the New York Central R. R., and harbor line: Buffalo Dredging Co., $142,500 (awarded contract); Frank V. E. Bardol, $144,900; Jos. F. Stabell Co., $148,000, and A. F. Chapman & Co., $150,000.

Newton, N. C.—See "Power Plants, Gas and Electricity."

Kings Mountain, N. C.—See "Power Plants, Gas and Electricity."

Mohall, N. D.—The citizens are reported to have voted to issue bonds for water works.

Elmore, O.—The citizens are reported to have voted on July 23 to construct water works.

Niles, O.—The Citizens' Water Co., of Niles, is reported incorporated, with a capital of $50,000. Directors: J. B. Barnard, Jos. J. Silveria, O. E. Walpert and others.

Ashland, O.—Bids will be received until Aug. 26 by the Bd. Trus. Pub. Affairs for furnishing and installing a water pumping plant at the pumping station, as advertised in The Engineering Record.

Jacksonville, Ore.—D. B. Fleck, of Portland, is reported to have petitioned for a franchise for water works.

Homestead, Pa.—Bids will be received until Aug. 16 by And. Hill, Boro. Clk. for furnishing c. I. pipe T's, stop gate valves, check valves and specials for a new water line; also distributing and laying c. i. pipe from 13th Ave. to new water tower at the reservoir; also disconnecting the present 14-in. line and lowering part of the same and reconnecting to the new line and setting gates, etc.

**Philadelphia, Pa.*—A contract aggregating $75,000 for c. i. pipe for the Water Bureau is reported to have been awarded on July 31 by the Dept. of Supplies to J. K. Dimmick & Co., New Land Title Bldg., Philadelphia. The pipe is to be used in extensions of the water service in West Philadelphia and the north-eastern district.

Bids will be received by Geo. R. Stearns, Dir. Dept. Pub. Wks., until Aug. 29 for Contract 110, electric machinery for Torresdale pumping station and Contract 119, sand washer pumps for Torresdale filter plant, as advertised in The Engineering Record.

Sisseton, S. D.—See "Schools."

Lewisburg, Tenn.—Bids will be received by the Board of Mayor and Aldermen until Aug. 20 for standpipe, foundation for same, c. i. water pipe, specials, etc., required in the construction of water works as advertised in The Engineering Record. L. J. Nance, Chmn. Water Com.; Engineer, Geo. Cadogan Morgan, 808 Royal Insurance Bldg., Chicago, Ill.

Lawrenceburg, Tenn.—See "Power Plants, Gas and Electricity."

Richmond, Va.—Supt. Bolling, of the Water Dept., is reported to be in favor of installing an electric power and pumping station at old pump house, to be used for lighting and pumping.

Victoria, B. C.—It is stated that bids will be received by Wm. W. Northcott, Pur. Agt., until Sept. 3 for supplying 5,000 ft. of 6-in and 15,000 ft. of 4-in. c. i. water pipe.

Portage La Prairie, Man.—The citizens are reported to have voted to issue $50,000 bonds for improving the water system.

Montreal, Que.—Bids will be received by the City Clk. until Sept. 6 for the construction of a reinforced concrete conduit for water supply. About 9 ft. diam. and 27,300 ft. long, as advertised in The Engineering Record. Geo. Janin, Supt. and Ch. Engr. Water Wks.

SEWERAGE AND SEWAGE DISPOSAL.

Notes Arranged Alphabetically by States.

Douglas, Ariz.—It is reported that plans and estimates are being prepared for a sewerage system.

Redlands, Cal.—The City Trus. are reported to have ordered plans prepared for a sewer system about 1 mile in length in the east section of city, on Stillman, Highway and Stuart Aves.

**Oakland, Cal.*—The Contra Costa Constr. Co. is reported to have secured the contract for constructing the 2d intercepting sewer for $11,059.

**Hartford, Conn.*—F. C. Ford, City Engr., writes that the lowest and successful bid opened on July 29 for constructing Sect. A of the Homestead Ave. intercepting sewer system was submitted by Andrew W. Bryne, 79 Milk St. Boston, Mass., at the following bid: 990 ft. 120-in. standard section concrete conduit, $22; 125 ft. 120-in. heavy section concrete conduit, $55; 1,100 ft. 48x72-in. egg-shaped concrete sewer, $10.40; 40 ft. 44-in. circular brick sewer, $13; 4 concrete manholes, ea., $50; 3 standard manholes, ea., $50; 2 syphon manholes, ea., $125; 10 house connections, ea., $15; 8 vitrified tile slants, ea., $1; days' time to complete, at $5 per day, 125 days; total cost, $41,998. Totals of other bids received: F. B. & W. H. O'Neil, 24 Pawtucket St., Hartford, $58,770; Chas. H. Slocomb, 55 Adelaide St., Hartford, $48,407; Eveline Bros., Waterford, N. Y., and New Britain, Conn., $47,286; F. T. Ley & Co., Inc., Springfield, Mass., $68,044; Falvey & Kelly, 15 Intervale Park, Dorchester, Mass., $43,774; Hartford Paving & Constr. Co., 703 Main St., Hartford, $42,691; and Russell Contr. Co., 156 5th Ave., New York, N. Y., $42,111.

Ansonia, Conn.—The State Legislature has passed a bill, authorizing Ansonia to issue $50,000 sewer bonds.

* *Items marked thus give the names of parties awarded contracts.*

Ft. Dade, Fla.—Bids will be received by Lieut. J. A. Thomas, Constr. Qm., until Aug. 30, for the construction of storm water drains at this post, as advertised in The Engineering Record.

Rome, Ga.—See "Water."

**Waukegan, Ill.*—M. R. Miller, Supt. Pub. Wks., writes that D. West & Co., 69 Loan & Trust Bldg., Milwaukee, Wis., has secured the contract for constructing the North Side sewer (bids opened July 19) at the following bid: 200 lin ft. 48 in. reinforced concrete, 4 ft. deep, $11.76; 2,400 lin. ft. 48 in. concrete, 3 ft. deep, $4.88; 1,300 lin. ft. 36 in. concrete, 10.6 ft. deep, $3.95; 830 lin. ft. 30 in. concrete, 11.2 ft. deep, $3.80; 2,330 lin. ft. 27 in. concrete, 16.3 feet deep, $3.45; 594 lin, ft. 24 in. concrete, 11.7 ft. deep, $3; 1,375 lin, ft. 21 in. vitr. pipe, 12.7 ft. deep, $2.18; 1,230 lin, ft. 18 in. vitr. pipe, 10 ft. deep, $1.85; 2,740 lin. ft. 15 in. vitr. pipe, 11.2 ft. deep, $1.78; 2,285 lin. ft. 12 in. vitr. pipe, 10.8 ft. deep, $1.65; 3,380 lin. ft. 9 in. vitr. pipe, 9.8 ft. deep, $1.42; 1,500 lin. ft. 6 in- vitr. pipe risers, 28 cts.; 200 lin. ft. 20 in. pipe, $5.33; 62 manholes, $40; 1 catch basin, $35; 1 lamp hole, $10; 15 flushing devices, $20; 200 cu. yds. concrete masonry, $9; 1 cu. yd. brick masonry, $17; 1 m. ft. lumber, $30; 1 cu. yd. excav., $1; 1 bulkhead, $175; 800 lin. ft. piles. 42 cts.; total $58,089. Totals of other bids received: H. D. Hallett, Aurora, Ill., $65,714; E. R. Harding, Racine, Wis., $62,891.

Pekin, Ill.—We are informed that all bids opened on July 29 by J. H. Soldwedel, City Clk., for constructing the 4th Ward sewer have been rejected, and new bids will be received on Aug. 12 at 8 p. m.; cost about $115,000. John R. Siebert, City Engr.

Herrin, Ill.—The City Council is reported to be considering the question of constructing a sewerage system.

Minonk, Ill.—The City Council is reported to have approved the plans of W. H. Irwin, of Ottawa, for a sewer system for Minonk.

Joliet, Ill.—The Council is reported to have authorized the Bd. of Local Improv. to prepare plans for a sewer system in certain portions of the 7th Ward.

Quincy, Ill.—Plans are reported as being about complete for the North End sanitary sewer. F. L. Hancock, City Engr.

Indianapolis, Ind.—Bids will be received until Aug. 14, by the Bd. Pub. Wks., (Jos. T. Elliott, Pres.) for constructing 10-in. pipe sewers in portions of Tecumseh, Pratt, 10th St. and an alley.

South Bend, Ind.—It is reported that bids will be received until Aug. 13 by the Bd. Co. Comrs. (W. A. McIery, Chmn.) for constructing a pipe sewer in Emerson Ave.

Peru, Ind.—The Bd. of Pub .Wks. is reported to have rejected bids recently received for the construction of 5 lateral sewers and will ask for new bids at once.

St. Louis, Mo.—Sewer Comr. Fardwell is reported to be preparing plans for the construction of a tunnel through the hill at Forest Park for the purpose of changing course of River Des Peres; it will be about 1¾ miles in length, 20x45 ft. wide, and cost several million dollars.

St. Louis, Mo.—See "Paving and Roadmaking."

Bozeman, Mont.—Harry A. Bolinger, City Clk., writes that it is proposed to construct pipe sewers, at a cost of $30,000. Engineer, C. M. Thorpe, of Bozeman.

Butte, Mont.—Alex. Leggat, City Engr., is reported to be preparing plans for a storm sewer to be located in the gulch west of Elcelsior Ave. It will be about 2,000 ft. long and will be 4x4x5½ ft. in diam. Bids will be called for on two plans, one of reinforced cement sewer, and the other of stone, with brick arch.

Wildwood, N. J.—Bids will be received until Aug. 13 by the Boro. Street Com. (Evans G. Slaughter, Chmn.), for reconstructing about 12,000 lin. ft. of the sewerage system of the Boro. L. M. Rice, Boro. Engr.

Newark, N. J.—Bids will be received until Aug. 15, by the Bd. Street and Water Comrs. (M. R. Sherrerd, Ch. Engr.) for constructing the Tyler St. sewers and branches, requiring 3,780 ft. 12, 10 and 8-in. deep and wide socket pipe, 3,880 6-in. house connections, 17 manholes, etc., also constructing the N. 13th St. sewer, requiring 1,425 ft. 12 and 10-in. pipe, 280 ft. 6-in. house connections, 9 manholes, etc.

North Plainfield, N. J.—The Borough Sewer Comn. (C. W. McCutcheon, Chmn.) has presented its report to Council, advising that a contract be entered into with the city of Plainfield for the disposal of the Borough sewage, and that collecting and outfall sewers to the city works be installed in accordance with the plans of Hering & Fuller, of New York, N. Y.

Honeoye Falls, N. Y.—See "Water."

Rochester, N. Y.—A site has been purchased on Winton Road and University Ave., in Brighton, for a new pumping station, to be erected in connection with the new sewer system, for the 21st Ward.

Medina, N. Y.—The citizens are reported to have voted to extend the trunk sewer beyond Glenwood Lake, at a cost not to exceed $16,000.

Long Island City L. I., N. Y.—Bids will be received until Aug. 15 by Jos Bermel, Boro. Pres., for constructing a temporary sewer in Chestnut St. and White-stone Ave. Engineer's estimate, 1,375 lin. ft., 12 in. Vitr. salt glazed or cement concrete pipe, sewer; 10 manholes, 10 M. ft. timber for bracing and sheet piling, etc.

Fulton, N. Y.—O. C. Breed, City Engr, writes that about $20,000 will be expended for vitr. pipe sewers.

Newark N. J.*—The following are the bids opened on July 18 by the Street and Water Comrs. for constructing Meadow Brook sewerage system, Sec. 1: (*a*) Chas. Oppolito, Orange; (*b*) Jas. A. Christie, Newark; (*c*) Pasqualle Cestone. Montclair; (*d*) G. M. Richards, Newark; (*e*) Fusco & Miele, Montclair, and (*f*) Wm. J. McCloud & Co., **Elizabeth (awarded contract) (Edw. S. Rankin is Engr. Dept of Sewers and Drainage.)

	a	*b*	*c*	*d*	*e*	**f*

Denison, Ia.—Bids will be received until Aug. 19 by the City Council for constructing 1,415 ft. 8-in. vitr. sewer pipe in Pine and E. Prospect Sts. O. M. Criswell, City Clk.

Abilene, Kan.—J. A. Graves, City Clk. writes that it is proposed to construct sewers in Dists. 4 and 5 at a cost of $5,000. A. L. Romig, City Engr.

Louisville, Ky.—Bids will be received by the Comrs. of Sewerage until Aug. 28 for the construction of the first sewer under recent $4,000,000 bond issue to be known as Happy Hollow Sewer, Contract 1. as advertised in The Engineering Record. J. B. F. Breed, Ch. Engr.

Togus, Me.—Maj. A. L. Smith, Treas. Eastern Branch, N. H. D. V. S., writes that no contract was let on July 31 for improving sewerage and drainage system, all bids received being too high.

**Westfield, Mass.*—The contract for building Sect. 13 of storm water sewer (bids opened Aug. 3) has been awarded to H. J. Crandall & Son Co., of East Boston, for $3,008.

Athol, Mass.—Bids will be received until Aug. 20 for the construction of about 8,500 ft. of sewers as advertised in The Engineering Record. Herbert L. Hapgood, Chmn. Sewer Comrs.

Battle Creek, Mich.—C. L. Simkins, 169 Parish St., has prepared plans for the Bd. of Pub. Wks. for a reinforced concrete storm water sewer to be constructed in Lake Ave. from Fountain St. to Tennyson Ave.; cost about $10,000.

Winnebago, Minn.—It is stated that bids will be received until Aug. 15, by the Village Council for constructing sewers with manholes, etc. J. H. Fherin, Village Clk.

Hastings, Minn.—See "Water."

Staples, Minn.—Bids will be received until Aug. 15 for a santary sewer system, consisting of approximately 9,000 ft. of sewer lines and a small concrete septic tank. Engineer, Oscar Claussen, of St. Paul.

Webster Groves, Mo.—Bids will be received until Aug. 19 by L. B. Ripley, City Clk., for constructing district sewers with necessary appurtenances in Sewer Dist. No. 1, as advertised in The Engineering Record. Engineers, R. E. McMath Surveying Co., 328 Lincoln Trust Bldg., St. Louis.

Hudson, N. Y.—See "Water."

Dunkirk, N. Y.—Prof. Ogden ,of the State Dept. of Health, is reported to have advised Mayor Einstein that the city should do away with the numerous sewer outlets at the lake front by constructing an intersecting sewer to carry all sewage to a point east of city near Battery Point.

Brooklyn, N. Y.—The lowest bid opened on July 31 by Bird S. Coler, Pres., Brooklyn Boro., for furnishing material and constructing relief sewer in Gold and Johnson Sts., Sec. 1, Div. 2, Gold St. system, was submitted by Rogers & Haggerty, 1929 Amsterdam Ave., N Y. City, at the following bid: 173 lin. ft. outlet Sect. A, $143.97; 40 lin. ft. outlet Sect. B, $152.35; 80 lin. ft. connecting chamber, $161.28; 1,910 162-in. circular sewer, $93.25; 1,431 lin. ft. 156-in. circular sewer, $57.33; 928 lin. ft. 150-in. circular sewer, $50.38; 20 lin. ft. 3x4-ft. 6-in. egg-shaped sewer, $21.45;150 lin. ft. 24-in. pipe sewer, $3.38; 730 lin. ft. 18-in. pipe sewer, $2.99; 2,190 lin. ft. 15-in. pipe sewer, $3.20; 4,645 lin. ft. 12-in. pipe sewer, $2.47; 30 lin. ft. 24-in. pipe temporary drain, $4.16; 130 lin. ft. 15-in. pipe temporary drain, $3.20; 205 lin. ft. 12-in. pipe temporary drain, $2.47; 4,130 lin. ft. 12-in. pipe sub-drain, 65 cts.; 3 manholes, Class "A," $260; 6 manholes, Class "B," $200; 2 manholes, Class "C," $130; 1 manhole on 3x4-ft. 6-in. egg-shaped sewer, $52; 72 manholes on pipe sewer, $50; 53 sewer basins reconnected, $25; 1,100 M ft. sheeting and bracing, $30; 420 M ft. foundation plank, $30; 1,000 cu. yds. Class "B" concrete, $7; 50,000 lin. ft. bearing piles, 30 cts.; 15 M ft. pile capping, $30; 2,000 lin. ft. oak fender piles, 50 cts.; 260 M ft. yellow pine sheet piling and wales, $80; 2,280 cu. yds. riprap or cobblestone fill, inside of coffer-dam, 75 cts.; 370 cu. yds. riprap, outside of coffer-dam, 75 cts.; total, $475,476. Totals of other bids were: Paul C. Grening Const. Co., Brooklyn, $478,856; M. C. Madsen, Brooklyn, $558,390; Builders Trucking & Material Co., Brooklyn. $520,097, and John J. Creem, Brooklyn, $570,521.

Bids will be received until Aug. 14 by Bird S. Coler, Boro. Pres., for furnishing material and constructing sewers in 2d, 17th, 8th and New York Aves., 43d, E. 7th, 58th, 56th, 74, 60 th, Dobbin, 55th, Commerce and 54th Sts., and sewer basins in several streets. Engineer's estimate, 11,999 lin. ft. 36, 30, 24, 18, 15 and 12-in. pipe sewer; 12,630 lin. ft. 6-in. house connection drain; 119 manholes; 58,500 ft. sheeting and bracing, etc.

North Tonawanda, N. Y.—The City Council is reported to be considering the question of calling an election to vote on issuing bonds for the construction of a sewer system, east of Division St., probable cost $75,000.

Whitesboro, N. Y.—Bids will be received until Aug. 19 by the Bd. Trus., for reconstructing certain portions of the sewerage system. J. C. Eberly, Jr., Village Clk. W. G. Stone, C. E., Mann Bldg., Utica.

Newton, N. C.—See "Power Plants, Gas and Electricity."

Casselton, N. D.—The question of constructing a sewerage system is reported under consideration.

Port Clinton, O.—It is reported that bids are wanted until Aug. 19 for constructing a branch sewer in Sewer Dist. No. 10. J. J. Burke, City Clk.

Cleveland, O.—Bids will be received until Aug. 13 by the Bd. Pub. Service (A. R. Callow, Secy.) for constructing sewers in portions of 9 streets.

Ironton, O.—The City Engr. is reported to have recommended the construction of a $60,000 sewer and flood defense.

Wadsworth, O.—The City Council is reported to be considering the question of constructing a sewage disposal plant.

**Dayton, O.*—Paul & Kerschner are reported to have secured the contract for the construction of the Riverdale intercepting storm sewer and pumping station (bids opened July 26) at $21,456 using concrete. The Backus Constr. Co. bid for this work, $22,310.

*Wm. Hilt is reported to have secured the contract for constructing Rubicon Creek storm sewer for $15,945.

**Cincinnati, O.*—Contracts for constructing sewers have been awarded by the Bd. of Pub. Service as follows: To J. E. Mahoney, 719 Whittier St., for sewer in Ravine, bet. Circle and Seegar Ave., $8,984, and for a sewer in Maria and Sturm Sts., $9,928, and to T. Maloney, 1858 Forest Ave., for sewer in Corben Pl. and Right of Way, $11,975.

Canal Dover, O.—This city will receive bids until Aug. 31 for the construction of a combined sewer system of sewer pipe; estimated cost, $18,037. Geo. E. Arnold, Engr., New Philadelphia, O.

Baden, Pa.—Bids will be received until Aug. 26 by the Town Council (L. F. Northrop, Secy.) for constructing a system of sanitary sewers. J. P. Leaf, Boro. Engr., Rochester, Pa.

Fayetteville, Tenn.—The question of constructing a sewerage system is reported under consideration here.

**Tacoma, Wash.*—The Lister Constr. Co. has secured the contract for constructing sewers in Dist. 166 (bids opened July 31) for $34,450.

North Yakima, Wash.—W. J. Roberts, Engr. of the State Dept. of Health, is stated to have decided to report in favor of a sewage disposal plant for North Yakima.

South Bend, Wash.—V. Heath, City Clk., writes that the plans of Dunn & Dunn, of Seattle, have been approved for a sewerage system to cost about $30,000. It has not yet been determined how much work will be done this year.

Aberdeen, Wash.—H. W. Trautman, City Engr., writes that all bids received on July 24 by F. F. Clark, City Clk., for constructing sewers in Sewer Dists. C and D, to consist of about 5 miles vitr. clay pipe sewers, from 6 to 24-in., with lampholes, Y's, etc.; manholes to be of concrete; flush tanks to be of concrete, with the Miller automatic system have been rejected and new bids will be called for.

West Allis, Wis.—Press reports state that bids are about to be asked for an intercepting sewer system, septic tanks and filter beds for the disposal of sewage.

Elroy, Wis.—Bids will be received by J. M. Dix, City Clk., until Aug. 31, for the construction of 6,643 ft. of 6 to 18-in. pipe sewers. W. G. KKirchoffer, Engr., Madison.

BRIDGES.

Notes Arranged Alphabetically by States.

San Diego, Cal.—As soon as City Engr. Crowell receives the profile drawing of the boulevard leading to the proposed bridge over Los Penasquitas River plans and specifications will be prepared for the bridge, it is stated; appropriation available, $7,200.

Portland, Colo.—It it stated that competitive plans and specifications will be received until Aug. 16 by T. W. Jaycox, State Engr., Denver, for a one or two-span 125-ft. reinforced concrete steel bridge.

Waterbury, Conn.—The following are reported to be the bids opened on July 30 by the Bd. of Pub. Wks. for constructing steel concrete bridge over Mad River at Liberty St.: Edw. McManus, $16,116; Gardner G. Riggs, $15,718, and Fred T. Ley & Co., Springfield, Mass., $15,171.

Hartford, Conn.—The Legislature passed a bill authorizing the Connecticut River Bridge and Highway Dist. to issue $500,000 bonds.

C., until Aug. 22, for furnishing sanitary fixtures, soil pipe and fittings, railway water tanks and standpipes, D. C. Engine and dynamo, switchboard, shop machines, locomotive springs, governors, electrical fixtures, magneto batteries, wire, hand drills, galvanized-iron roofing, etc., as per circular No. 382.

Philadelphia, Pa.—See "Water."

Lawrenceburg, Tenn.—Bids will be received until Aug. 20 by Jas. T. Dunn, City Secy., for $25,000 water and light bonds.

San Antonio, Tex.—The San Antonio Gas & Electric Co. is reported to have decided to construct a large addition to its plant.

Marshall, Tex.—It is stated that bids will be received until Aug. 14 by H. S. Rice, City Secy., for constructing about 22 miles of concrete sidewalks and street crossings.

Wharton, Tex.—John W. Maxcy, Binz Bldg., Houston, has been employed by A. P. Borden & Co., of Wharton, to prepare plans and specifications for a power plant for the irrigation of 20,000 acres of rice land.

Richmond, Va.—See "Water."

Tacoma, Wash.—The following are the bids opened on July 31 by Owen Woods, Comr. of Pub. Wks., for the construction of the municipal power plant: Geo. Milton Savage Co., hydraulic power plant of 10,000 h.p., $1,750,000; steam turbine plant of 4,000 h.p., $440,000; Jas. C. Drake, steam or turbine plant of 4,000 h.p., $500,000. The bids were submitted to Council to select the best bid with the view of submitting the proposition to the people.

Spokane, Wash.—The Big Bend Light & Power Co. is reported organized to furnish light and power to cities and towns in Big Bend County. Incorporators, D. B. Fotheringham and H. L. Bleeker, of Spokane, and Eugene Men'e, of Medical Lake.

Prentice, Wis.—Chas. Ferguson, of Antigo, is reported interested in the construction of a dam on Jump River, for the development of the water power for electrical purposes.

Campbellford, Ont.—Bids will be received until Sept. 5, (extension of date) by Mayor W. J. Doxsee, for rock-cutting, concrete work, turbine wheels, generators, etc., for 4,000 h.p., and about 2¼ miles of transmission line for power development at Middle Falls on the Trent River. John S. Fielding, Consulting Engr., 15 Toronto St., Toronto.

Dawson, Yukon District, Canada.—Press reports state that A. B. Palmer, manager of the Yukon Smelting & Power Co., which has projected a smelter and power scheme for the Whitehorse district, states that plans are being prepared to build a smelter at Whitehorse with a capacity of 2500 tons of ore a day. Also plans to install a plant, and to furnish electrical power for the mines being considered.

Montreal, Que.—The Shawinigan Water & Power Co. is reported to have acquired the controlling interest in the North Shore Power Co. and will largely increase the output of the plant of the North Shore Co. by the installation of modern electrical machinery.

ELECTRIC RAILWAYS.

Notes Arranged Alphabetically by States.

Stockton, Cal.—An ordinance is stated to have been passed granting the Central California Traction Co. (E. P. Hilborn, Gen. Mgr.), a franchise in this city.

San Jose, Cal.—The San Jose, Los Gatos Interurban Ry. Co. (F. E. Chapin, Gen. Mgr.), is stated to have applied to the Bd. of Superv. for a frachise for a single-track electric railway over certain highways in the county of Santa Clara.

Redding, Cal.—F. L. Evans is stated to have applied to the City Trustees for a franchise to operate a double-track electrical railroad through streets of Redding, and same to become a part of the system of the Eureka & Redding Ry.

Oakland, Cal.—The Oakland Traction Cons. Co. (W. F. Kelly, Gen. Mgr.) is reputed to have made application to the City Council for a franchise for a street car line to run along 13th Ave.

**Waterbury, Conn.*—John Fagan's Sons is stated to have been awarded the contract for the construction of 4 miles of the Woodbury-Waterbury Electric Railway. Their contract begins at Quassapaug and runs through Woodbury Center.

Nauvoo, Ill.—The Mississippi Valley Electric Ry. Co. is reported to having awarded the contract for the construction of its road to Ft. Madison, Ia., to the Federal Constr. Co. of New York, N. Y.

New Orleans, La.—It is said that the New Orleans St. Ry. Co. (H. J. Dressel, Supt.), is contemplating an extension of its Orleans St. line from the City Park race track to the lake shore and then to West End, where a connection will be made with the double tracks from Canal St. along the New Basin.

Hagerstown, Md.—It is reported that the Chambersburg, Greencastle & Waynesboro Electric Ry. Co. (I. J. Durall, Ch. Engr., Meadowlands) which owns and operates the electric railway running from Greencastle to Pen-Mar Park via Waynesboro, have in contemplation the building of an extension from Greencastle to Chambersburg, and a short line from Shady Grove, where their system connects with the Hagerstown Electric Ry., to the proposed Chambersburg-Greencastle line, the point of intersection being about 3 miles north of Greencastle.

Shelburne Falls, Mass.—The Shelburne Falls & Colrain St. Ry. Co., (C. A. Marcy, Mgr., Colrain) is stated to have received the franchise from the Selectmen of Buckland for the proposed extension across the river from Bridge St. to the Boston & Maine station.

Adrian, Mich.—M. Antoine Robert, of Montreal, Que., is reported to be promoting an electric railway which will run from Adrian to Detroit. It will be known as the Detroit & Adrian Traction Co., and it will be capitalized at $2,000,000. It is said that the company has received liberal franchises from Adrian, Tecumseh and Milan. Outside the cities the road will be built on a private right of way.

**Jackson, Mich.*—W. E. Tench & Co., of Detroit, are stated to have secured the contract for the grading of the proposed Lansing-Jackson Electric Ry. by the Northern Constr. Co.

Joplin, Mo.—The Joplin & Pittsburg St. R. R. Co. is stated to have filed with the City Clk. its acceptance of the amended franchise granted by the City Council. D. B. Holmes. Work on the construction of the interurban line between Joplin and Pittsburg will be started as soon as a right of way can be obtained.

Utica, N. Y.—The Utica Southern R. R. Co. has filed its maps in Oneida and Madison Counties and is reported to be preparing to extend the line from Hamilton to Norwich, a distance of about 22 miles. The surveys will be begun shortly. The total length of the line will be 43 miles, and the Waterville branch will be 5 miles.

Syracuse, N. Y.—The Bd. of Trustees of East Syracuse is stated to have granted the Syracuse Rapid Transit Ry. Co. (C. L. Allen, Gen. Mgr.), a franchise to double track its line from the western boundary of the village, through Burnet Ave. to Clark St., bridging over the New York Central tracks, to Manlius and Hartwell ts., near Ellis St.

Canandaigua, N. Y.—It is stated that the Canandaigua-Southern Ry., between Atlanta, Steuben County, and Canandaigua, is to be built this fall. Only the 6 miles between Atlanta and Naples will be completed at first. Franchises have been secured from Cohocton, Atlanta and Naples.

Flushing, L. I., N. Y.—It is stated that the New York & Queens County Ry. Co., (F. L. Fuller, Gen. Mgr., Long Island City) intends to make extensions of its lines to Whitestone and Bayside in the near future. A tract of 6 acres of land on the Flushing Meadows was recently purchased to be used for the laying out of storage yards and auxiliary power plant and the construction of car houses and repair shops.

Cleveland, O.—The Toledo & Ft. Wayne Electric Ry. Co., of Cleveland, $10,000 capital is stated incorporated by F. J. Pinney, H. J. Nord, Lewis A. Goldstein, Thos. C. Willard and John E. Lowry. They will construct, maintain and operate an electric railway connecting Toledo and Fort Wayne, Ind., and passing through Lucas, Defiance and Williams Counties, Ohio, and Allen County, in Indiana.

Wellington, O.—Right of way is stated to have been secured through Penfield Township, east of here, for the new Elyria Southern Electric Ry. W. E. Elliott, W. E. Moser, F. N. Carpenter, J. M. Starr and J. J. Sargent are the incorporators, with $100,000 capital.

Eugene, Ore.—The required $60,000 stock subscription for the electric railway which Stephen Carver proposes to build from Eugene to the mouth of the Sinslaw River, is stated to have been secured and construction is assured. The next step will be the organization of a company with Mr. Carver as president, after which construction will begin. It is planned to build at least 10 miles this summer and fall and to complete the first 30 miles by next summer.

Lancaster, Pa.—Papers are stated to have been filed at the Court House here for the extension of the Lancaster & York Furnace St. Ry. lines from Pequea to York Furnace, and thence across the Susquehanna River on a new bridge, making a connection between the Lancaster and York County systems.

Providence, R. I.—Ahern Bros. are reported to have received two contracts, the first to build the 6-mile extension of the electric road from Westerly to Pleasant View, and the second one to build a branch track to Ashaway, a distance of about 5 miles.

San Angelo, Tex.—J. H. Ransom, of Hereford, Tex., is stated to have petitioned for a franchise to build an electric railway in San Angelo. The City Council has passed the franchise to the third reading, and if it is finally passed actual work will begin within six months.

Wenatchee, Wash.—Articles of incorporation of the Chelan Electric Co. are stated to have been filed. Capital, $500,000, to build an electric railway from Wenatchee to the western part of Washington. J. T. McChesney, Pres., and E. C. Mony, Secy.

Centralia, Wash.—The City Council is reported to have granted a franchise to the Centralia-Chehalis Electric Ry. & Power Co. to construct an electric railway between Chehalis and Centralia.

Spokane, Wash.—The Spokane & Inland Empire Ry. Co. (J. B. Ingersoll, Gen. Mgr.), is stated to have announced that they have in contemplation the building of a line from Colfax to Walla Walla, Wash., and the extension of system from Moscow to Lewiston, Idaho.

Madison, Wis.—The Interstate Transfer Ry. Co., of Superior, is stated to have filed articles of incorporation in the office of the Secretary of State. The company proposes to build a road connecting Superior and Duluth, a distance of 20 miles. Capital, $600,000. Incorporators: Sol. L. Perrin and W. W. Savage, of Superior, and Joseph B. Cotton, Geo. L. Rels and Wm. A. McGonagle, all of Duluth.

RAILROADS.

Notes Arranged Alphabetically by States.

Birmingham, Ala.—At recent meetings of the Bd. of Directors of the Alabama Terminal Co. was decided to amend charter so as to locate and construct a railroad from Bone Gap to Adamsville also, or to increase the capital of the company from $2,000,000 to $3,000,000.

Pensacola, Fla.—Press reports state that bids have been asked for grading all of the Pensacola & Northeastern R. R., which is to extend from Pensacola to Andalusia, Ala., and also for 20 miles of the Pensacola, Alabama & Western R. R., which will run to Memphis, Tenn. The distance of the Andalusia road is 85 miles, making a total of 105 miles.

Hawkinsville, Ga.—A charter has been granted to the Gulf Line Ry. Co. This is said to be a renewal and extension of the charter of the Flint River & Gulf R. R. now in operation from Hawkinsville through several of the counties named in the petition. It is proposed to operate the Gulf Line Ry. through the counties of Pulaski, Wilcox, Turner, Worth, Mitchell, Florida line in Decatur, thence through Florida to the Grady & Decatur to a point on the Gulf coast; the length of the line in Georgia will be about 130 miles, and capital $400,000. Incorporators: C. A. Alford and R. H. Pinson, of Sylvester; T. R. Bennett and W. N. Spence, of Camilla; Morgan Tompkins and T. H. Bridges, of Hawkinsville, and others.

Pinebloom, Ga.—The Ocilla, Pinebloom & Valdosta R. R. Co. is reported to have secured a charter to construct a railroad from Ocilla to Valdosta, 45 miles in length; capital $200,000. Chas. E. Gray and J. L. Cochran are among the incorporators.

Abbeville, Ga.—Chas. D. Caffery, of Lafayette, is reported interested in the construction of a railroad from Eunice by way of Lafayette to Abbeville.

McAlester, Ind. Ter.—The McAlester Southwestern R. R. Co. is reported formed by A. S. McKenon, Dr. E. N. Allen and C. F. Dawley, of McAlester, to construct a railroad from near Sallisaw to the Red River, in Comanche County, Okla.; capital, $5,000,000; length of road is 250 miles.

Worcester, Mass.—The State R. R. Comrs. are reported to have approved plans of the Special Grade Crossing Comn. for the abolition of grade crossings at the station of the Boston & Albany R. R. (Walter Shephard, Ch. Engr., Boston) and New York, New Haven & Hartford R. R. (E. Gagel, Ch. Engr., New Haven, Conn.) in Worcester. The plans involve the expenditure of $3,000,000. The matter will now go to the Superior Court for a final decree authorizing the work of abolition.

Dillon, Mont.—See "Business Buildings."

**Buffalo, N. Y.*—The City Council on July 31 approved award of contracts to John Johnson, 548 Perry St., for substructure of subway in Bway at Bailey Ave. at $135,026, and for substructures of viaducts in Kensington, Dewey, Leroy and Jewitt Aves. and Main and Amherst Sts. over Belt Line tracks, at $112,785. This is the city's share of grade crossing work on the crossings of the N. Y. Central R. R., bids for which were opened on July 13 by the Grade Crossing Comr.

**Buffalo, N. Y.*—Press reports state that the New York Central & Hudson River R. R. Co has awarded to the Eyr Shoemaker Corp., of Philadelphia, Pa., the contract for eliminating all its grade crossings within the city limits of Buffalo for $4,000,000.

Nelson, B. C.—E. C. Arthur, Secy. Bd. School Trus., writes that the $60,000 school bonds have not yet been sold, and it is probable that no contract for the erection of the 12-room school (bids for which were to have been received until July 15) will be let until 1908.

NEW INDUSTRIAL PLANTS.

See also "Business Buildings."

Canon City, Colo.—It is reported that the city of Canon City will donate $2,500, and the towns of South Canon and Prospect Heights have agreed to provide the balance of $4,000 for the purchase of a site of ground, about 2 miles south of this city, for the Tri-Billion Smelting Co., of New York, N. Y., on which they will erect a $200,000 smelting plant. The plant will have a capacity of 50 tons a day on the start. It will be constructed in units of 50-ton capacity, and added to as the business increases. Work will begin on the plant as soon as title to the ground can be secured.

Middletown, Conn.—The plant of the Wilcox & Crittenden Co., on South Main St., is reported to have been badly damaged by fire on July 31. The company manufactures marine hardware.

Ft. Dade, Fla.—See "Water."

Chicago, Ill.—The plant of the Chicago, New York & Boston Refrigerator Co. at 51st St. and Central Park Ave. is reported to have been badly damaged by fire on July 30.

It is reported that the Raymond Lead Co. has secured a site and intends erecting a plant to cost about $500,000.

Des Moines, Ia.—C. C. Cross & Co., Good Blk., are reported to have completed plans for a 3-story 80x40-ft. building to be erected for the Allen B. B. E. Flour Co. (E. W. Allen, Vice-Pres.) at a cost including equipment of $25,000.

Bellevue, Mich.—A. F. Gertsell, Easton, Pa., has bought for the North American Portland Cement Co., of which he is vice-president, about 400 acres of cement rock lands, where a mill of about 3,000 bbl. capacity will be erected. The company has perfected plans for the construction of other plants elsewhere.

St. Louis, Mo.—The General Compressed Air & Vacuum Machinery Co. (John S. Thurman, Pres.), 4436 Olive St., it is stated, has increased its capital stock from $120,000 to $750,000 for the building of a new factory on Jefferson Ave., between Lafayette and Geyer Aves., to cost about $200,000 and cover an acre of ground.

**Paterson, N. J.*—H. Walter Baer is stated to have awarded to the David Henry Bldg. Co., 6 Smith St., the contract to construct a silk mill on the Riverside Section of the city. The plans, which were prepared by Franklin Von Winkle, Colt Bldg., provide for a main mill building 205x52 ft. 8 in., 2 stories high, with basement story under one-half, in addition to silk soaking-room, and separate engine and boiler rooms. In addition to power plant, the new mill will afford about 25,000 sq. ft. of manufacturing space, and will be provided with spacious fireproof silk vaults, offices, elevators, etc. The mill plant will cost about $50,000.

Camden, N. J.—Ballinger & Perrot, 102 S. 12th St., Philadelphia, Pa., it is reported, have completed plans for 2 additional factories and a power plant to be erected for the Victor Talking Machine Co. in Camden at a cost of $200,000. Bids are due on Aug. 7. The 2 additional factories will be erected at 2d and Cooper Sts., and the power plant to be installed will have a capacity of 4,000 h.-p. One of the new buildings will be 92x174 ft., with one story and basement and provisions for five additional stories to be erected later. The other will be 6 stories 80x173 ft. Both buildings will be built of brick with stone trimmings. The column, floor and roof construction will be of reinforced concrete with slag roof covering. Concrete saw-tooth skylights will also be provided in the roof. There will be a tower fire escape in each building, and a passenger elevator and a large freight elevator.

Kingston, N. Y.—G. W. Van Slyke and Wallace N. Horton, of the firm of G. W. Van Slyke & Horton, of Albany, have, it is stated, with the Lopez-Grau Co., of Kingston, purchased a lot 100x230 ft in Kingston on which a modern brick factory, 66x160 ft. and 4 stories high, will be built and equipped with the very latest cigar machines. 1,000 hands will be employed.

West Albany, N. Y.—We are informed that Reed & Stem, 5 E. 42d St., N. Y. City, have prepared plans for the following work contemplated at West Albany for the New York Central & Hudson River R. R. Co.: Boiler, tender and tender truck shop; size of building to be 125x430 ft.; total cost of building, $210,000.

Akron, O.—The Interstate Gypsum Co. (M. F. Dirnberger, Attorney), whose main office is to be in Buffalo, N. Y., is stated to have filed articles of incorporation with a capital of $150,000, and intends erecting a mill in Akron, to cost about $75,000.

Welland, Ont.—Bemis Bros., of Boston, Mass., it is reported, propose erecting a bag factory here, to cost about $1,500,000.

* *Items marked thus give the names of parties awarded contracts.*

STREET CLEANING AND GARBAGE DISPOSAL.

Ross, Jacksonville, Fla., $3.10; P. Sanford Ross, Inc., Jersey City, N. J., $3.03, and Southern Dredging Co., Mobile, Ala., $3.98.

**Chicago, Ill.*—The Otis Elevator Co., of New York, N. Y., has secured the contract for installing dumbwaiter in U. S. Post Office for $2,095.

**Marshalltown, Ia.*—F. G. Dunahugh, Aud. of Story County at Nevada, Ia., writes that the contract for constructing ditch or drain in Marshall-Story Drain Dist. No. 1 (bids opened Aug. 1) has been awarded to Tho. Dangerfield, of Rinard, Ia. The work to consist of the following: Sec. 1, 5,130 ft. open ditch, about 6,500 cu. yds.; Sec. 2, 5,000 ft. 30-in. and 2,800 ft. 26-in. tile; Sec. 3, 3,000 ft. 20-in., 3,400 ft. 18-in. 5,400 ft. 16-in. and 4,200 ft. 12-in. tile; Sec. 4, 5,500 ft. 16-in., 1,200 ft. 14-in. and 1,800 ft. 12-in. tile; Sec. 5, 2,000 ft. 20-in., 4,100 ft. 18-in. and 2,900 ft. 14-in. tile; Sub Branch 1 of Sec. 5, 1,800 ft. 12-in. and 200 ft. 14-in. tile.

Boone, Ia.—It is stated that bids will be received until Aug. 13, by the Co. Aud. for constructing drain No. 30, in 10 sections.

Ft. McHenry, Md.—Bids will be received until Aug. 14 by J. Barry Mahool, Pres. Bd. Awards, Baltimore, for constructing a pile and timber pier and for certain other work connected therewith for use of the Naval Reserves, Ft. McHenry. O. F. Lackey, Harbor Engr.

Sandwich, Mass.—Bids will be received by the Bd. of Harbor and Land Comrs. at Boston, until Aug. 16 for improving entrance to Scorton harbor at East Sandwich, as advertised in The Engineering Record. Frank W. Hodgdon, Ch. Engr., Boston.

Boston, Mass.—Bids were opened on Aug. 2 by the Harbor and Land Comrs. as follows:

Excavating channel at Rock Creek, Eastham and Orleans, 14,000 cu. yds. (price per cu. yd.): Chas. H. Thomas, Middleboro, Mass., 43 cts.; W. H. Ellis, 17 Milk St., Boston, 49 cts.

Building stone jetties at Cuttyhank Harbor, 4,000 tons (price per ton): E. S. Belden & Sons, 217 Laurel St., Hartford, Conn., $3.59; and Thomas & Connor, Middleboro, Mass., $2.54.

Detroit, Mich.—Bids will be received until Aug. 26 by Col. Chas. E. L. B. Davis, Corps Engrs., U. S. A., Detroit, for furnishing and delivering about 600 M ft. timber at St. Marys Falls Canal.

Grand Rapids, Mich.—The Bd. of Pub. Wks., (Chas. M. Wilson, Pres.) on July 25 rejected bids received on July 18 for constructing 4,000 cu. yds. concrete walls, excavating 18,000 cu. yds. rock and 8,000 cu. yds. earth in connection with flood protection work at Grand Rapids, all being too high and will receive new bids. L. W. Anderson, City Engr.

Ft. Snelling, Minn.—Bids will be received until Sept. 3 by Maj. Amos W. Kimball, Constr. Q. M., U. S. A., St. Paul, for constructing a ditch at Ft. Snelling.

**St. Paul, Minn.*—The Otis Elevator Co., of New York, N. Y., has secured the contract for installing elevator in U. S. Post Office, for $6,245.

**Breckenridge, Minn.*—The State Drainage Bd. at St. Paul on July 31 awarded contracts for constructing Otter Tail River cut-off in Wilkin County and the Grand Marais extension in Polk County to the Standard Drainage Co., of Windom, at 9.3 cts. and 10.5 cts. per cu. yd., respectively.

**Billings, Mont.*—Gaynon & Co. have secured the contract for constructing Danford drain ditch in Yellowstone County, for $25,000. Henry Gerharz, of Billings, Engr. in Charge.

Portsmouth, N. H.—The following are the bids opened on July 20 at the office of the Bureau of Yards and Docks, Navy Dept., Washington, D. C., for blasting in front of Quay Wall, Navy Yard, Portsmouth, N. H. (Specification No. 1,548): (*a*) Dredge whole area complete in accordance with plan; (*b*) for complete work with modifications. R. G. Packard Co., 130 Pearl St., New York, N. Y., *a* $169,000; Eastern Dredging Co., 247 Atlantic Ave., Boston, Mass., *a* $126,867, *b* $122,867; Johnston & Virden, Lewes, Del., *a* $122,900, *b* $119,900.

Camden, N. J.—Bids will be received until Aug. 15, by Jas. E. Hewett, Chmn., Finance Com., City Council, for $15,000 Park bonds.

Hackensack, N. J.—Bids will be received by the Hackensack Improv. Comn. until Aug. 20 for the construction of a flat topped concrete drain connecting the brook with the sewer in Union St., together with wing walls, air flap, guard rail, etc., as advertised in The Engineering Record. Engineer, Lemuel Lozier, Bank Bldg.

Newark, N. J.—The following are the bids opened on July 29 by Col. D. W. Lockwood, Corps Engrs., U. S. A., Army Bldg., New York, N. Y., for dredging in Newark Bay and Passaic River, N. J. (price given per cu. yd. scow meas.): Midland Land & Improvement Co., 62 Cedar St., New York, N. Y., 16.25 cts.; Morris & Cummings Dredging Co., 17 State St., New York, N. Y., 23.2 cts.; P. S. Ross, Inc., 277 Washington St., Jersey City, N. J., 36.4 cts.; the International Contr. Co., 17 Battery Pl., New York, N. Y., 26 cts.; the W. H. Beard Dredging Co., 21 State St., New York, N. Y., 22.9 cts.

Albany, N. Y.—The following are the totals of bids opened on July 31 by F. C. Stevens, State Supt. Pub. Wks., for improving the New York State canals as follows:

Contract 12, Erie Canal—Secs. 6 and 7—Excavation of the canal, protection of sides, construction of Lock 23 and appertaining structures; bridges. abutments and bridge approaches and other incidental details, bet. deep water at west end of Oneida Lake, Sta. 2720, and Mosquito Point Bridge over Seneca River at east end of Contract No. 5, Sta. 5074. Length of contract, 43.73 miles: One bidder, Stewart, Kerbaugh, Shanley & Co., 527 5th Ave., N. Y. City, $3.391,716. Engineer's estimate, $3,082,500.

Contract 14, Erie Canal—Sects. 1, 2 and 3.—Dredging channel in Mohawk River bet. west end of Contract 11, Sta. 305, and a point near upper Mohawk aqueduct, at Rexford Flats, Sta. 1046; for constructing dam 2 below Crescent Aqueduct, Sta. 305; Dam 3 and Lock 7 above Vischer's Ferry, Sta. 839; Dam 9 and Lock 13 at Yosts, Sta. 2954; Dam 10 and Lock 14, at Canajoharie, Sta. 3307; Dam 11 and Lock No. 15, at Ft. Plain, Sta. 3554; retaining dam at Mindenville, Sta. 3865; highway changes; culverts, and incidental work appertaining thereto. Length of contract, 15 miles: The Scofield Co., Pennsylvania Bldg., Philadelphia, Pa., $3,357,776; Arthur W. Luce, 100 Bway, N. Y. City, $2,935,763; Stewart, Kerbaugh, Shanley & Co., 527 5th Ave., N. Y. City, $3,163,137. Engineer's estimate, $2,875,570.

Contract 35, Oswego Canal—Sect. 1.—Excavating canal and protecting sides; constructing Locks 7 and 8; bulkheads, culverts, spillways and incidental details between 0.56 of a mile above Utica St. Bridge, Sta. 1164+00, and harbor line north of Bridge St. Bridge, Sta. 1208+85, at Oswego, N. Y. Length of contract, .85 of a mile: Stewart, Kerbaugh, Shanley & Co., 527 5th Ave., N. Y City, $865,689; Gilmour-Horton-Allen Co., Sandy Hill, N. Y., $739,261. Engineer's estimate, $752,760.

**Mineola, L. I., N. Y.*—Revised bids for constructing sea-wall on east side of Shore road at Oyster Bay are reported to have been opened on Aug. 5 by the Nassau County Superv. and the Abbott-Gamble Co., 32 Bway., N. Y. City, secured the contract for both sections of wall, at $5.16 per cu. yd.

New York, N. Y.—Bids will be received by J. A. Bensel, Comr. Docks, until Aug. 19, for furnishing materials and putting in place rip-rap stone, as per Contract 1191.

Bids will be received by J. A. Bensel, Comnr. Docks, until Aug. 21, for furnishing material and building freight sheds on Piers Nos. 60, 61 and 62, and on the adjacent bulkhead platforms or lateral extensions bet. W. 19th and W. 22d Sts., on the North River, Boro. Manhattan, as per Contract 1091.

The lowest bid opened on Aug. 1 by Moses Herrman, Pres. Park Bd., for furnishing material and grading and improving grounds north of the Municipal Building in Crotona Park was submitted by A. E. Guidone, at the following bid: 500 cu. yds. earth excav., 80 cts.; 5,000 cu. yds. rock excav., $1.80; 25 cu. yds. concrete in found., $5; 50 cu. yds. rubble masry. in found., $5.50; 100 cu. yds. broken range Ashler masry., $9.50; 675 cu. ft. limestone masry., $3.50; 20 walk basins, ea., $80; 600 lin. ft. 8-in. vitr. pipe, $1.25; 250 lin. ft. blue-stone steps, $1.95, and 100 sq. yds. asphalt walk, $3.05; total, $16,255. Totals of other bids: Tony F. Carfagno, $18,135; Leahy Contr. & Constr. Co., $17,125; McHarg-Barton Co., $17,162; Chas. Schneider, $17,350, and Frank T. Willigan, $22,534.

Bids will be received by J. A. Bensel, Comr. of Docks, until Aug. 15, for furnishing material and repairing and rebuilding a portion of the pier at the ft. of W. 132d St., North River, known as Pier No. 122, as per contract 1,087.

Bids will be received by Denis A. Judge, Deputy and Acting Comr. Docks, until Aug. 15 for furnishing lumber as per contract No. 1058 (class 3).

**New York, N. Y.*—The following are the bids opened on July 26 by J. A. Bensel, Comr. of Docks, for furnishing and building freight sheds on piers Nos. 54 and 56, North River, bet. foot of Little W. 12th and 14th Sts., on the Chelsea section, with lateral extensions on the adjacent bulkhead platforms: Snare & Triest Co., 143 Liberty St., $1,132,580 (awarded contract); R. P. & J. H. Staats, $1,219,000; Post & McCord, Inc., $1,154,000, and Geo. B. Spearin, $1,240,167.

West Point, N. Y.—Bids will be received by Maj. J. M. Carson, Jr., Q. M., U. S. M. A., until Aug. 26 for furnishing treated iron pipe for electric ducts, as advertised in The Engineering Record.

Brooklyn, N. Y.—Bids will be received by J. A. Bensel, Comr. Docks, New York City, until Aug. 16 for furnishing material and placing filling in rear of ferry structures at 39th St. Boro. Brooklyn, as per contract 1,088.

The Sinking Fund Comn is stated to have received favorable report on proposition of Dock Comr. Bensel to get lands on South Brooklyn waterfront for docks. It is part of his proposition to expend $29,000,000 for improvements of New York City's docking properties. These lands lie between 28th and 36th Sts. and 57th and 61st Sts. and 2d Ave. and the bay. The land for which the purchase was approved will cost about $6,000,000. The improvements will cost $10,000,000. Some of the piers are to be 1,200 ft. long and will be steel and fireproof.

Stapleton, S. I., N. Y.—Bids will be received by J. A. Bensel, Comr. of Docks, New York City, until Aug. 16 for furnishing materials and placing filling in the rear of the ferry structures at Canal St., Stapleton, Boro. Richmond, as per contract 1,089.

Dayton, O.—Bids will be received until Sept. 3 by Edw. Phillips, City Aud., for $31,000 bonds, to provide money to purchase land for park purposes and for improving same.

Panama.—See "Power Plants, Gas and Electricity."

Panama.—Bids will be received by D. W. Ross, Gen. Purchasing Officer, Isthmian Canal Comn., Washington, D. C., until Aug. 14, for furnishing motor car, railway water tanks and accessories, duplex pumps, boilers, steel, brass, drag scrapers, friction wheels for dredge, dipper lips for steam shovels, ore cement, mechanical shakers, etc., as per Circular 381.

The following are the bids recently received by the Isthmian Canal Comn. at Washington, D. C., for dump cars: (*a*) all metal, 12 yds. capacity; (*b*) double dump cars, 4 yds. level full: Standard Steel Car Co., Pittsburg, Pa., *a* $622,500, delivery at New York, Dec. 1, 1907, to Apr. 1, 1908; Western Wheel & Scraper Co., Aurora, Ill., *a* $645,000, *b* $25,415, delivery at New York, Oct. 1 to Mar. 1; W. J. Oliver Mfg. Co., Knoxville, Tenn., *a* $562,500, *b* $25,725, delivery at New Orleans, La., Oct. 1, 1907; Russell Wheel & Fdry. Co., Detroit, Mich., *a* $697,500, delivery at New York, Nov. 15 to Mar. 10, 1908; American Car & Fdry. Co., New York, *a* $554,000, delivery at New York, Jan. 15 to Mar. 1; Continental Car & Equipment Co., New York, N. Y., *b* $19,515, delivery at New York in Nov.; Kilgore-Peteler Co., Minneapolis, Minn., *b* $28,635, *b* alternate $28,175; Arthur Kappel, Pittsburg, Pa., *a* $665,000, *b* $34,500, delivery in New York, June 1, 50 cars, Class 2 delivery Feb. 1, 100 cars; Kilgour & Jacobs Mfg. Co., Columbus, *a* $215,000, deliver 25, New York, Jan 15, then 25 monthly, b $25.875, alternate *a* 50 cars, $107,500.

**Potsville, Pa.*—The Lehigh Coal & Navigation Co. is reported to have awarded to the Portland Contrg. Co., of Pottsville, a contract for the construction of a mine tunnel between Mauch Chunk and Nesquehoning by which 13 collieries in the Panther Creek Valley will be drained. The tunnel will be 7,200 ft. in length.

Erie, Pa.—Governor Stuart is reported to have appointed a commission of five, including Chas. Olds, M. H Taylor, Henry Beckman, all of Erie, to have charge of the construction of a public steamboat landing or wharf on state lands at the port of Erie; the recent State Legislature appropriated $150,000 for its construction.

Providence, R. I.—Bids will be received by Lieut. Col. J. H. Willard, Corps. Engrs., U. S. A., Newport, until Sept. 4 for dredging in Providence Harbor, R. I., as advertised in The Engineering Record.

**Norfolk, Va.*—The Chas. McDermott Constr. Co., of Washington, D. C., is reported to have secured the contract for grading work in connection with the steel pier of the Virginia Ry., now under construction at Sewall Point; contract price for this work is $49,000.

Bids will be received by Maj. Jos. E. Kuhn, Corps Engrs., U. S. A., until Sept. 4 for dredging harbor at Norfolk, as advertised in The Engineering Record.

Bremerton, Wash.—Press reports state that all bids opened on July 27 at the office of the Bureau of Yards and Docks, Navy Dept., Washington, D. C., for Dry Dock No. 2, of concrete and granite at the Navy Yard, Puget Sound, Wash. (Specification 1542) have been ejected, as none of the bids submitted contemplated completing the dry dock as desired by the Navy Dept. appropriation, $1,250,000.

Two Rivers Harbor, Wis.—Bids will be received by Maj. W. V. Judson, Corps. Sngrs., U. S. A., Milwaukee, until Sept. 3, for removing old pier, building pile pier, dredging, etc., at Two Rivers Harbor, Wis., as advertised in The Engineering Record.

Toronto, Ont.—Bids will be received until Aug. 13 by E. Coatsworth (Mayor), Chmn. Bd. Control, for sheet piling on north side of Keating's channel, near foot of Cherry St.

THE NEWAYGO SEPARATOR FOR CEMENT MILLS.

Mr. W. J. Bell, of the Newaygo Portland Cement Co., Newaygo, Mich., has designed and thoroughly tested a separator in which the frame is rigid; the frame is not shaken, but the screen cloth itself is vibrated like a piano wire. This apparatus is styled the Newaygo Separator, and is an inclined vibrating screen, framed and enclosed in steel. The screen cloth is automatically kept in strong, uniform tension, and is vibrated by small hammers constantly tapping its protected surface. This simple device for producing vibrations is stated to secure astonishingly rapid and sharp movements, yet of small amplitude, which give material in process of screening the least possible projection, and offer it innumerable opportunities to pass through clean screen openings before the tailings escape at the foot. Owing to the rapid and effective vibrations of the screen cloth, the small cleansing shocks cannot become deadened because the screen automatically maintains its required tension.

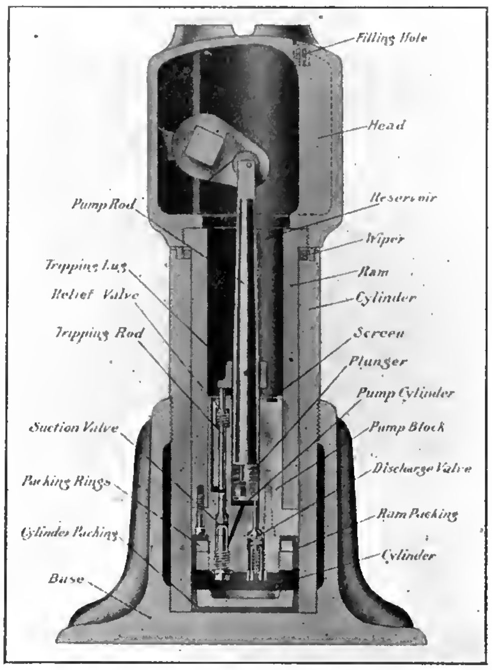
All its surface works all the time, and it is considered no small advantage that coarse wire and meshes can be used to produce the desired output with the same screening area, for large wires are clearly more durable than small ones. In an inclined, vibrating screen, coarse wire can be successfully used for very fine work, because inclining the screen surface diminishes the size of the openings, and the little sharp vibrations keep the openings clear.

The fineness of output can be controlled to a considerable extent by changing the inclination of the screening surface. The screen, or screens, (one or two screens of any mesh up to 100 may be used) can be readily withdrawn for replacement or cleaning. The output that may be obtained from Newaygo Separators is from ½-in. up to 200 mesh, with capacities varying from 40,000 lbs. per hour down to 1,000 lbs., according to the material and fineness of screen cloth.

Mr. Bell has seventeen of these inclined, vibratory separators in constant use at the Newaygo Portland Cement Works, and believes that they solve the problem of simple, economical screening. The Sturtevant Mill Company, of Boston, Mass., has underwritten this separator, and hereafter it will be sold exclusively by them.

A NEW HYDRAULIC JACK.

A type of hydraulic jack shown in the accompanying illustration has recently been brought out by the Joyce-Cridland Co., of Dayton, Ohio. It consists essentially of two hollow concentric steel cylinders machined to sliding contact with each other. The outer cylinder is fixed in a steel base and the joint packed with a copper cup to withstand great pressure. The inner cylinder is closed at the top by the "head" and at the bottom by the "pump block," thus making a reservoir, in which the filling



A NEW HYDRAULIC JACK.

liquid is held. The pump block derives its name from the small pump contained therein and connected through the piston rod to the lever outside. Movement of the lever forces the liquid through suitable valves into the space between the lower end of the pump block and the bottom of the outer cylinder, thus pushing the base and head apart with a positive movement.

The filling device consists of a plug with two valves one opening inwardly and the other outwardly, both being held to their seats by springs of sufficient stiffness to prevent the liquid escaping as the jack is laid down, but sufficiently elastic to allow the entrance and escape of air to and from the cistern as the ram is worked up and down.

A wiper, placed around the ram at the top of the cylinder, is saturated with oil and, in addition to wiping off any dirt from the ram as it passes down into the cylinder, lubricates the sliding surfaces, keeping them smooth and unscored. Should this foreign matter be allowed to enter the cylinder, it would also cut the packing on the pump block and get under the valves, rendering them leaky. The liquid is strained by a fine screen on top of the pump block, through which all liquid must pass before reaching any delicate working parts and surfaces.

When the plunger is raised, the suction valve is drawn from its seat and oil passes through the filter screen, through the passage shown in the extreme left of the pump block, past the suction valve and into the pump cylinder. When the plunger is lowered, the suction valve closes and the liquid forces the discharge valve open, passes by it and through the openings in the side of the valve cap into the cylinder, thus raising the ram. The illustration shows the plunger at the lower end of the normal stroke, in which position the end of the pump rod touches the discharge valve stem and at the same time the tripping lug further up on the pump rod comes into contact with the suction valve stem. A slight additional length of stroke trips the jack, opens both these valves and allows the liquid to pass back to the cistern by the same channels through which it came. A lug on the operating lever coming in contact with a stop on the outside of the ram head prevents the stroke from being prolonged so far that the end of the plunger would touch the valve openings. The speed at which the jack may be lowered in this way is regulated by the pressure which the operator exerts on the lever.

A valve is provided on the upper end of the tripping rod, which prevents the pump taking air when the level of the liquid has fallen below the tripping rod. This valve is held by a spring of sufficient stiffness to prevent its unseating under the suction of the pump plunger, but it yields to the positive action of the tripping lug.

The tripping mechanism is positive and under the direct control of the operator. It does not depend upon springs and cannot fail to act. In starting, the lever is turned with the lug pointing up, raised slightly to remove the pressure in the pump cylinder and to allow the suction valve to fall from its seat, then lowered slowly to allow the liquid to flow back from the pump cylinder to the reservoir.

THE KANSAS CITY PORTLAND CEMENT WORKS.

A 2,000-bbl. mill has recently been completed by the Kansas City Portland Cement Co. on the Atchison, Topeka & Santa Fe R. R. near Kansas City. It is built from the plans of Mr. W. H. Caffery and is located at the base of a high bluff composed of alternate strata of limestone and shale.

Tramway tracks lead from the base of quarry to the crusher building, cars being conveyed to the inside and dumped. The building is located on the side of the bluff on a bench quarried out of solid rock, built of concrete, and is 100 feet above the center of the main building. The crushed rock and shale pass by gravity from crushers to the dryers, which are located in a separate dry house, built on a bench below the crusher building. Below the crusher building are located the dry storage bins. These bins are built of concrete and have a capacity of 900 cu. yds. The tops of these bins are built up to a level with the floor of the dryer building, and extend partially under it. The crusher building is equipped with two Austin gyratory crushers, which are operated by electric motors. In the dry room are two rotary dryers, each 60 ft. long and 6 ft. in diameter. Dry shale storage is provided for with a bin built beside the rock storage bins. The capacity of this bin is 300 cu. yds.

Special weighing cars are operated on narrow gauge tracks which extend into the dry material bins from the edge of the bluff at the bottom of which is located the main plant. This track is all under cover and the man in charge at this plant has telephone connection with the chemical laboratory. The main mill building is 100x530 ft., and is 30 ft. in height to eaves. The foundations of this building are all of concrete, the superstructure being steel frame, sided with 2 in. of 1 to 3 cement mortar, laid on expanded metal. A concrete floor is laid throughout this building.

Eighty per cent. of the power used in the entire plant is supplied directly by the machines, and the other twenty per cent. is transmitted electrically. The power plant occupies a space of 110x100 ft. in the main building, and is divided from the remainder of the interior of this building by dust proof walls, constructed in the same manner as the outside walls.

The engine room contains two 1,000 h.-p. cross-compound condensing straight Corliss engines and three 200 k.-w. 440 volt, three-phase, alternating-current generators, two of which are each directly connected to a 300 h.-p. four-valve Hamilton engine, the third being held in reserve, is connected by belt to a main line shaft. The engines are all operated condensing being served by a C. H. Wheeler surface condenser.

Water is supplied to the plant from a pumping plant located on the river bank above high water mark. Here Worthington centrifugal pumps are used, being operated by electric motors. The bottom of the pump pit is below extreme low water mark. Water is siphoned into the pump pit through two 14-in. pipes, a small air pump being used to start the flow.

The raw materials machine room contains six Jeffrey hammer mills ,and six Allis-Chalmers tube mills, all be-

ing belted to the main line shaft extending through the room. In addition to screens built in these mills, the materials are passed through rotary screens, the tailings of which are passed back to the hoppers by bucket elevators.

The finished raw product of the tube mills is raised by bucket elevators to screw conveyors, which deliver same to the housings of the kilns in the adjoining kiln room.

The kiln room is 100x210 ft., and contains four 8x125 ft. rotary kilns, and three 6x60 ft. rotary clinker coolers. Four kilns are set in pairs, with one housing to each pair. The kilns are fired by oil, at three pounds pressure, the Little low pressure system with blower and large nozzle being used. Each kiln is driven separately by a 30 h.-p. variable speed motor. Rotary coolers are also each driven separately by 30 h.-p. variable speed motors. Clinker is delivered by a bucket elevator from the kilns to coolers. Coolers discharge into one-yard, side-dump, ball-bearing Koppel cars, which are raised to an elevated track by a motor driven freight elevator.

The clinker storage bin, built of reinforced concrete, has a clinker capacity of 50,000 barrels. The finishing room is 68x126 ft. in size, and contains 14 Bradley Griffin mills, and four standard Allis-Chalmers tube mills. Bucket elevators handle the product from Griffin mills to tube mills.

From the elevator, the finished product is delivered to cement stock house by screw conveyors. The stock house is built of reinforced concrete divided into four bins, which have a total capacity of 125,000 barrels. The packing room in the stock house is equipped with electrically driven packing machines, and automatic scales. Two switch tracks, each 1,000 ft. long, extend alongside the stock house, giving ample room for cars.

THE SYLPHON REGITHERM.

A new system for controlling the temperature in rooms, developed by Mr. W. M. Fulton, of Knoxville, Tenn., is based on the use of a device called the Sylphon Regitherm. The system operates by moving the dampers of the heating furnace or boiler by means of a "motor" forming a part of the regitherm, which is placed in the room or hall from which the temperature is to be controlled. The motor is a metal vessel with deep corrugations in its wall like those of a Japanese lantern. This wall is a single piece of metal, which not only give flexibility to the vessel, but also a very large radiating surface. Although such a wall 5 in. in diameter and 3 in. long weighs but 12 ounces, it readily resists a hydraulic pressure of 100 lb. to the square inch. Within this vessel is hermetically sealed a small amount of a volatile liquid having a vapor which changes its pressure at the rate of 0.5 lb. per square inch for each degree change in temperature. This liquid does not have to be replenished. The head of the vessel is 30 sq. in. in area, so that a change of a single degree in the temperature develops a force of 15 lbs. within the motor. This force is sufficient to expand the end of the vessel a distance of half an inch, which movement is magnified eight-fold in being transmitted to the dampers in the furnace flue. Means are provided within the regitherm to neutralize the spring in the vessel, so that there is no increased resistance offered by the expansion or contraction. It is stated that a change of a single degree in the room where the device is placed is sufficient to move the damper, if the latter is balanced and moves freely. The closed vessel operates a short lever arm at the back of the regitherm, causing it to rise with a rising temperature and fall with a falling temperature. A small wire cable leads from this lever arm to the damper. The range of operation is from 60 degrees to 80 degrees, and it can be adjusted to operate at any temperature within these limits by simply turning a key. The strength of the motor is shown by the fact that a man weighing 150 lbs. will be lifted several inches by it inside of a minute by placing a lighted candle under it. This device is being manufactured by the Fulton Company, of Knoxville.

THE WEST POINT, GA., HYDRAULIC DEVELOPMENT.

Among recent development in the South the undertaking of the West Point Mfg. Co., of West Point, Ga., is one of the most extensive. This company through its engineers, Mr. Chas. T. Main, of Boston, and his hydraulic expert, Mr. John F. Porter, is constructing a dam across the Chattahoochie River at Langdale, Ala., a few miles below West Point, and a 200x40-ft. reinforced concrete power house.

The hydraulic equipment will consist of two 39 in. and eight 60 in. Improved New American Turbines of the vertical shaft type and arranged for installation in open concrete flumes. These turbines will operate under 13 ft. head and develop over 3,000 h.-p. The vertical shafts will be extended sufficiently to place the gearing and harness work for the horizontal shafts on the power house floor approximately 10 ft. above head water level. Each of the 39 in. wheels will drive by means of bevel mortise gears a horizontal shaft at 165 r. p. m., from which a 100-kw. exciter will be belted. Four of the 60 in. turbines will drive a 750-kw. 150 r. p. m. three-phase revolving field, 60-cycle generator, there being two turbines on each side of the generator, connected by bevel gears to horizontal shafts which will be directly coupled to both ends of the generator shaft. The other four 60 in. turbines will be divided into two units, each consisting of two wheels geared to a common jack shaft and direct connected to a 550-kw. 150 r. p. m. three-phase revolving field 60 cycle generator.

There will be 19 sets of head gates for regulating the flow of the water into the wheel chambers, each of these gates being about 8½ ft. wide and 10½ ft. high, of the double stem type and operated by special worm wheel and spur rack hoisting mechanisms.

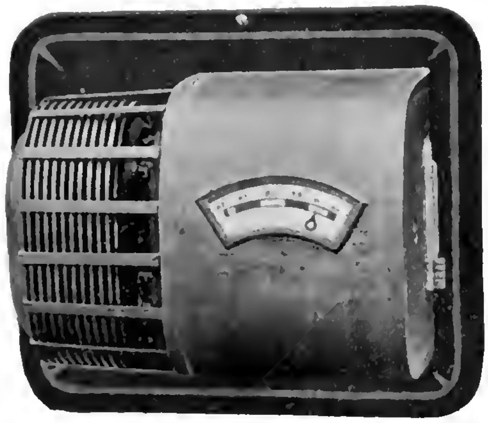
The water wheel machinery complete with all gearing, harness work, head gate hoists, trash racks, etc., is being built by the Dayton Globe Iron Works Co., of Dayton, Ohio, while the electrical apparatus will be furnished by the Westinghouse Electric & Manufacturing Co., of Pittsburg, Pa.

PERSONAL NOTES.

Louis C. Dittler, engineer of the street department of Newark, N. J., died recently at his home in that city, aged 53 years.

Mr. La B. Harrison, of New York City, has been appointed division engineer of the Eastern Division of the New York State Canals.

Mr. E. L. Trowbridge has been appointed assistant to the engineer of construction of the Louisville & Nashville R. R., at Nashville.



THE SYLPHON REGITHERM.

Mr. Harry Magoun, superintendent of the Marine Department of the Maryland Steel Co., has resigned to become assistant to the president of the New York Shipbuilding Co.

Mr. S. B. Storer, consulting electrical engineer, has opened an office at 732 University Block, Syracuse, N. Y., where he will give special attention to power transmission problems and enterprises, and investigations and reports of electrical and industrial undertakings.

Maj. William C. Langfitt, Corps of Engineers, U. S. A., commandant of the Engineer School and Washington Barracks, has been appointed a member of the board to consider field equipment for engineer troops, in place of Maj. E. E. Winslow, Corps of Engineers, relieved.

Mr. J. Robertson Stewart has resigned as assistant engineer of the Chicago track elevation of the Pennsylvania R. R. to become chief engineer of the George C. Callahan Co., of Chicago, for whom he will be in charge of concrete work on the Illinois Central R. R., at Memphis.

Messrs. James Wigman and Albert Martin, formerly employed by Messrs. Lewis & Kitchen, of Chicago, the latter as chief engineer, have formed a partnership, under the firm name of Martin & Wigman, for the practice of general engineering and contracting at Green Bay, Wis.

The Fourth Annual Convention of the National Association of Cement Users will be held at Buffalo, N. Y., Jan. 20 to 25, 1908. The old 65th Regiment Armory has been engaged for the exhibition, and the convention probably will be held in the same building. Mr. Richard L. Humphrey, of Philadelphia, is president.

Lieut.-Com. William H. G. Bullard, U. S. N., has been appointed as head of the department of electrical engineering that is to be established at the United States Naval Academy. Prof. Stimson J. Brown has been designated as head of the combined department of mathematics and mechanics, to succeed Prof. William W. Hendrickson, retired.

Mr. W. W. Horn, formerly superintendent of the Memphis Asphalt Co.'s plant at Memphis, Tenn., and of Mr. A. G. Pugh's plant in Columbus, O., has been engaged by the Board of Public Service of the latter city to superintend the construction of the Columbus municipal asphalt repair plant, and to act as general superintendent of asphalt repair work when the plant has been completed.

At the meeting of the Association of American Portland Cement Manufacturers at the Marlborough-Blenheim Hotel, Atlantic City, Sept. 11, Mr. E. S. Larned will read a paper on what the cement industry needs in the control and regulation of the cement block trade, Mr. R. L. Humphrey will give an illustrated talk on the work of the Structural Materials Testing Laboratory at St. Louis, and Mr. J. B. Porter will discuss electrical equipment in cement plants.

Mr. L. H. Taylor, supervising engineer in charge of the Government reclamation project at Fallon, Nev., has resigned, but will remain in the service as consulting engineer until the works, which are about completed, are put in service. Mr. J. M. Quinton, supervising engineer for Colorado and Utah, is to have his territory extended to include Nevada, and Mr. R. R. McGregor, at present assistant to Mr. Taylor, will have direct charge of the work at Fallon.

Mr. John C. Ostrup, of New York City, has been appointed to the chair of structural engineering at the Stevens Institute of Technology, Hoboken, N. J. He is a graduate of the Polytechnic School in Copenhagen, and has had wide experience in structural work, particularly elevated railways, having been closely associated with the construction of the Chicago elevated lines and designing engineer of the Boston Elevated R. R. Upon the completion of the latter road he engaged in private practice as a consulting engineer. Later he was associated with the American Bridge Co.

Prof. Charles Henry Benjamin has resigned as professor of mechanical engineering at the Case School of Applied Science, Cleveland, Ohio, to become dean of the Schools of Engineering of Purdue University, Lafayette, Ind., succeeding Prof. W. F. M. Goss, who resigned recently to become dean of the College of Engineering of the University of Illinois. Prof. Benjamin has been associated with the Case School as professor of mechanical engineering since 1899, prior to which time he was, for three years, engaged in engineering practice and, for six years, instructor and professor of mechanical engineering in the University of Maine, of which institution he is a graduate.

BUSINESS NOTES.

The Building Engineering Co. has been organized in Los Angeles, Cal., and has opened offices in the Citizens' National Bank Building. Mr. C. Wesley Roberts, the president, designed and constructed the Lankershim and the Citizens' National Bank Building, Los Angeles. Mr. E. R. Robinson, formerly operating chief engineer of the Los Angeles Pacific R. R., is chief engineer for the company, and Mr. J. W. Mitchell, attorney. The company's specialty will be reinforced concrete construction.

Milliken Brothers (Inc.), New York, are continuing in full operation their structural steel and ornamental metal departments, and are prepared to quote favorable deliveries on all kinds of steel and iron fabrication.

The Pennsylvania R. R. has installed in its Altoona shops a 5-ton, 3-motor electric traveling crane of 55 ft. span, built by the Northern Engineering Works, Detroit, Mich.

The Superior Steel Co., Carnegie, Pa., has placed an order with the Wm. B. Scaife & Sons Co., Pittsburg, for a 4,750 h.-p. addition to its We-Fu-Go water softening and purifying plant. The water is taken from Chartiers Creek and makes the company independent of the city supply.

The Chapman Valve Manufacturing Co. has combined its St. Louis storerooms and offices and located at 16 S. Twelfth St. Within the last year the company has doubled the capacity of its factory.

Important orders for school house ventilating apparatus recently taken by the B. F. Sturtevant Co., Boston, Mass., include the following: Oyler School, Cincinnati, O.; Caney School, Kansas City, Mo.; New School, Independence, Kan.; Elliott School, Lincoln, Neb.; Old High School, Kansas City, Mo.; No. 9 School, Rochester, N. Y.; Framingham High School, South Framingham, Mass.; Winchell School, Boston, Mass.; Lynchburg High School, Lynchburg, Va.; Public School, Biwabik, Minn.

The Philadelphia office of the Edison Portland Cement Co. will be moved on Sept. 1 to the Arcade Building, and will be in charge of Mr. James T. Wakeman as local representative. The office of Mr. E. Meyer, manager of sales, will be at the St. James Building, New York.

Ehret's slag roofing, which is guaranteed against natural wear and tear for ten years by its makers, the Warren Ehret Co., Philadelphia, is the subject of a well-illustrated trade circular. The roofing is applied either to wooden or concrete roofs, and consists of four layers of felt covered with a composition of which slag is the most important component. The illustrations show buildings roofed with this material.

TRADE PUBLICATIONS.

A small book regarding the materials made by the Expanded Metal & Corrugated Bar Co., St. Louis, and their use in the construction of fireproof buildings, has just been issued. In addition to stating the claims of the corrugated bar, it illustrates different types of reinforced concrete floor construction and gives a table of safe loads for floor slabs for different spans, together with the thickness of the slab and the reinforcing recommended.

The Northern Engineering Works, Detroit, has issued a booklet describing a great variety of types of electric and hand-operated cranes and hoists. Most of the illustrations show the apparatus in use. Electric traveling cranes ranging in capacity from 5 to 50 tons, air hoists and jacks, jib cranes of every type, locomotive cranes, clam-shell bucket, cranes and hoists for handling coal, sand and similar material, and overhead tracks and trolleys, are shown.

The National Construction Co., Buffalo, has sent out a catalogue of its portable and sectional houses, which describes their construction and advantages. Either wood or steel can be used n their construction, and the finish can be either very plain or quite elaborate, to accord wth the taste of the purchaser. They are listed in all sizes from 6x9 ft. to 36 ft. square. One of the uses of such buildings to which attention is called in particular is for the storage of automobiles, since they are readily installed on any part of the property if the owner should not have a sutable shelter for a car.

The Shone system of sewerage is described quite completely in a pamphlet sent out recently by the Shone Co., Chicago. As shown by the list of installations printed at the end of the book, the system is used not only for sewering towns and cities but also in hotels, office buildings, factories, theatres and similar large structures. The descriptions of the installations of the pneumatic ejectors in the sewerage works of Rogers Park, Ill., Winona, Minn., the World's Fair, Chicago and at Fair Haven, Mass., give an excellent idea of the difficulties which the ejector aims to overcome and of the assistance it is intended to afford in solving difficult sewerage problems.

Crown pneumatic hammers are described in detail in bulletin 2010 of the Ingersoll-Rand Co. They are made in five sizes for chipping, calking, scaling, and flue beading, and in four sizes with a long stroke for driving rivets from the smallest size up to 1¾ in. diameter. The bulletin also gives an interesting account of a displacement air meter by which the performance of these tools has been tested.

Several mechanical draft plants of large size are illustrated in a booklet recently published by the Green Fuel Economized Co., Matteawan, N. Y. Among the installations are those for the East St. Louis & Suburban Ry., and for the new Hoboken terminal of the Lackawanna R. R. Numerous diagrams show clearly the method of applying mechanical draft to plants originally installed without it, as well as its use in plants expressly designed for it. Attention is called to the Green fuel economizer, which the company frequently installs in connection with its draft system.

A description of its plant and the process used in treating timber with creosote is published in a brief pamphlet from the Gulfport Creosoting Co., Gulfport, Miss. The plant contains three cylinders, each 7 ft. in diameter, two of them being 120 ft. long each and the third 96 ft. long, their total monthly capacity being 2,000,000 ft. B. M. The timber treated includes piles, telephone poles, bridge timbers, railroad ties, cross arms, conduits, paving blocks and similar classes of material. The specifications recommended by the company for both the timber and the creosote oil are given in detail.

The Everett-McAdam continuous electric blueprint machine, made by the Revolute Machine Co., New York, is fully described in a recent catalogue. The prints are made while the tracing and paper are revolved about a glass cylinder inside which are two or more mercury vapor lamps. The speed of ordinary rapid electric blueprint paper through the machine is 4 to 5 ft. per minute.

McLaughlin Bros., Inc., Baltimore and Philadelphia, have issued a pamphlet covering their work as engineers and constructors, containing views of different classes of buildings erected by them.

The Chester B. Albree Iron Works Co., Allegheny, Pa., has devised a handy diagram for obtaining graphically by a single simple reading the length of round, countersunk and cone-head rivets, for thicknesses of plates, or grip, up to 8 in., and for all diameters of rivets. Copies of the diagram mounted on cardboard will be sent on application.

A book of specifications for applying hydrolithic waterproofing to floors, foundations, walls, columns, girders and conduits has been published by the E. J. Winslow Co., Chicago. Typical designs are also given in a set of drawings showing the hydrolithic system applied to quite a variety of waterproofing conditions.

An illustrated bulletin showing rails, ties, switches, frogs, turntables and rolling stock for industrial and portable railways has been received from the Arthur Koppel Co., Pittsburg, Pa. The illustrations of rolling stock for such railways show a great variety of steel dump cars, and mine, ore, charging, platform and steel-handling cars.

The five types of Simplex concrete piles which are used for various purposes are described in a pamphlet distributed by the Foundation Co., New York. It explains the construction and special field of each type, and gives illustrations of many structures which have foundations of such piles.

Centrifugal and turbine pumps are discussed in a bulletin recently issued by the D'Olier Engineering Co., Philadelphia, Pa. The advantages of the volute and turbine types for various classes of service are pointed out and the mechanical details of construction are described. Suggestions are also offered in regard to securing information necessary to select the best pump for a given service.

The electrification of the West Jersey & Sea Shore R.R. is interestingly described in a pamphlet by the General Electric Co. The line runs between Philadelphia and Atlantic City, and the pamphlet describes the power plant, transmission system, inspection shed, third rail installation, rolling stock, motor and control equipments, trucks and brakes. Other bulletins recently issued by the General Electric Co. relate to the standard G. E. cast-iron grid rheostats for electric railway purposes, the parts of all standard General Electric electric railway controllers for both stationary and car motors, and the Thomson single-phase high torque induction watt meters.

Wire-glass windows as a fire protective measure is the subject of a comprehensive article published in a recent issue of the Journal of Fire, special reference being had to the wire glass product of the Mississippi Wire Glass Co. Wire glass, it is stated, was invented to prevent breakage, but its advantages as a fire stop were an unexpected and important result and have been emphasized by the results obtained in the Baltimore and San Francisco conflagrations. Extended reference is made to its advantages for this purpose and a list of wire glass installations in different parts of the country each notable for its size, is added.

The Sarco Fuel Saving & Engineering Co., New York, has recently issued a circular concerning a new form of grate bar for use in the Roney stoker. The bar is so constructed as to avoid burning out and obtains greater life, as well as greater steaming capacity for a given size of grate

A new edition of its catalogs of pipe threading and cutting machinery has recently been issued by the Curtis & Curtis Co., Bridgeport, Conn., makers of the Forbes patent die stock. The complete line of the latter stocks for either hand or power operation, is listed, together with repair parts for these machines. The catalog also includes an extensive list of hand tools for pipe threading and also pipe and machine bolt taps.

The Kewanee flange union is described in a circular recently issued by the Western Tube Co., Kewanee, Ill., which is a new product of this company. It is a brass seated malleable iron union with flange attachments, the seat of which is ground spherical so that the union seats properly and is tight even when the piping is not in perfect alignment.

Buffalo forges are illustrated in a folder recently issued by the Buffalo Forge Co., which calls special attention to the fact that the No. 200 Buffalo hand blower is now built with four legs and a clamp brace between them, together with a new style of head, fastening the blower to the stand, the whole enabling the outfit to be knocked down and easily packed for shipment. The No. 660 down-draft is now made with one length of cast-iron pipe, so that the entire outfit is practically all of cast-iron and should withstand the most severe service.

The Fort Wayne Electric Works has recently issued a number of pamphlets describing belted direct-current generators, enclosed alternating-current multiple arc lamps, and type A alternating-current transformers. Important improvements have been introduced in all of this apparatus, which are described at length.

The Van Auken system of vacuum heating is described in a series of pamphlets and folders recently issued by the Consolidated Engineering Co., Chicago. The details and operation of the system are well illustrated and the uses of the Belvac thermofier are described. This is used in this system to permit all air and water of condensation to pass freely, but prevents any steam from being wasted into the returns. The details of the thermofier and its method of connection to the system are also illustrated.

Bulletins recently issued by the General Electric Co. include a brief description of the company's direct current fan motors for 1907, a treatise upon commutating pole railway motors, and a description of electric crane motors adapted to drum hoists. Other bulletins show that in generating machinery a new line of C .Q. generators and balancer has been brought out in sizes up to 17½ kw., which correspond in form or construction to the type CQ motors recently placed on the market, and also a new line of direct-current multipolar generators, known as type R, has been developed, in capacities from 25 to 200-kw., the details of which are presented in a separate bulletin. Another bulletin describes the General Electric train lighting system, in considerable detail, using the Curtis turbine generator sets on the locomotive.

"Drying Materials in Industrial Plants" is the title of a pamphlet just issued by the Green Fuel Economizer Co., of Matteawan, N. Y., which takes up the drying of various materials, as fabrics, clothes, malt, lumber, baking powder, paper, paper pulp, sugar, etc. Besides describing and illustrating the fans, blowers, steam coils, etc., manufactured by this company for use in drying plants, an interesting account is given of the nature of drying and the text is illustrated by drawings and photographs of plants for many different purposes. This pamphlet also describes the Green air heater, which utilizes the waste heat in the flue gases from boiler or other furnaces for heating and drying purposes.

Two pamphlets from the Arlington Manufacturing Co., Canton, O., describe paints made especially for coating galvanized iron and for the special purposes required on railroads. Among the list of paints of the latter class are those for structural steel work, wooden and steel freight cars, station buildings and car signs.

The Davenport Locomotive Works has issued a pamphlet on locomotives for railroad contractors, describing the merits of its product. A partial list of users of Davenport locomotives is given.

Information on tarviating heavily-traveled macadam streets, furnished by Mr. Linn White, engineer of the South Park Commissioners, Chicago, has been published in pamphlet form by the Barrett Manufacturing Co. During 1906 the Park Board treated 106,000 sq. yds. of heavily-traveled boulevards, including parts of Michigan Avenue, and Grand and Drexel Boulevards. The method of applying the Tarvin, the amount used and cost per square yard, and the results are given in detail.

The Morris single rope dumper, for dumping coal, ore, rock, and similar material automatically is described in a catalog of the Bergen Point Iron Works, Bayonne, N. J. The dumper uses a round tub which engages a tipping frame at the point where it is to be discharged, and the continued pull of the hoisting rope empties the tub, which is released as soon as the rope is slackened. This device makes it unnecessary to have more than one man for hoisting and dumping. The dumper is usually fitted with a discharge chute, and the entire apparatus is readily portable and can be swung into position with a simple tackle, a convenience that will be readily appreciated for unloading ships, handling concrete, and in such places where portability is required. The catalogue also shows wheel-barrow tubs, a very low spoil car, and a dumping frame for the same, and numerous views of coal-handling machinery designed by Augustus Smith, president of the Bergen Point Iron Works.

A catalog of 114 pages describes fully the Miracle concrete block, the machinery for making it and the methods employed. Interchangable face plates for 69 different styles of finish can be supplied with the machines. Special moulds are also made for cornices, ornamental belt courses, sills, lintels, columns and balusters and sewer pipe. Much space is devoted to illustrations of buildings constructed with Miracle blocks and to letters from contractors who have used the company's machines. The machines are made by the Miracle Pressed Stone Co., Minneapolis, Minn.

The Weber subterranean pump is described in a folder issued by Geo. H. Samson Co., Boston, Mass. This is a pump operating on the principle of direct displacement by air and is specially adapted for handling acids, gritty water or semi-solids and is manufactured in the mine, quarry, river supply and sewage disposal types. It is stated that there are no floats or special degree of submersion required and that air is returned to the compressor under pressure after the water is discharged by means of which a considerable factor of economy in operation is secured.

"More Holes for Less Money" is the title of a small folder recently issued by the Knecht Bros. Co., Cincinnati, Ohio, devoted to the Knecht friction drive drill. This is an upright sensitive drill built in both belt and motor-driven patterns and has a friction-cone drive for rapidly varying the drilling speeds. It has a graduated scale on the latter to indicate the proper speeds for any drill up to its limit in capacity, 9-16 in.

The Percival Reinforced Concrete Steel Tie Co., Galveston, Tex., has issued a pamphlet describing its reinforced concrete ties, which were illustrated in this journal about a year ago.

A catalogue describing a new make of concrete measuring and mixing machinery has come from Mr. A. F. Nims, Rochester, N. Y. The measurer can be used for any proportions and with stone up to maximum dimensions of 5 in., and gauges the proper quantities accurately. It operates by gravity and has a large daily measuring capacity. The mixer is of the cubical type and is run by a 5-h.p. gasoline engine.

CONTRACTING NEWS

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS, ENGINEERS AND MANUFACTURERS

ENGINEERING AND BUILDING SUPPLIES

WATER.

Notes Arranged Alphabetically by States.

[illegible], Ala.—See "Power Plants, Gas and Electricity."

Sterling, Colo.—D. A. Bartbolow, of Sterling, Secy. North Sterling Irrig. Dist., writes that bids will be received on Aug. 20 for the proposed reservoirs, ditch, etc., to cost about $1,400,000. Engineer, Walter Pearl, 214 Commonwealth Bldg., Denver.

Lamar, Colo.—Bids will be received until Sept. 2 at the office of C. W. Heaton, Town Clk., for $150,000 bonds for the proposed extension and improvement of the water works system.

East Hartford, Conn.—Engr. C. Henry Olmsted, of East Hartford, on Aug. 2, submitted to the voters of the East Hartford Fire Dist., his report on increasing the water supply of the district. He estimates the cost of laying new water main from reservoirs in East Glastonbury through Hillstown to connect with present main at Burnside Ave. and Church St., a distance of 7⅛ miles, at $73,305. J. Goodwin is Town Clk.

Wilmington, Del.—The Water Dept. is reported to have authorized Theo. A. Leisen, Ch. Engr., to prepare specifications for a filtration plant.

Pensacola, Fla.—Bids will be received until Sept. 7 at the Bureau Yards and Docks, Navy Dept. (R. C. Hollyday, Ch.), Washington, D. C., for constructing a 100,000-gal. steel tank and tower, Navy Yard, Pensacola, Fla., as per specification No. 1,558.

Bids will be received until Sept. 7 at the Bureau Yards and Docks, Navy Dept. (R. C. Hollyday, Ch.), Washington, D. C., for installing a water system at the navy yard, Pensacola, Fla., as per specification No. 1,559; estimated cost, $38,000.

**Atlanta, Ga.*—The Special Com. of Council and Water Bd. is reported to have on Aug. 8 decided to purchase the New York sectional wash filter plant from the New York Continental Jewel Filtration Co., of New York, N. Y., for $30,000.

Lewiston, Idaho.—The North Lewiston Water Co., Ltd., is reported incorporated. The company has secured water rights on a number of springs and land adjoining Lewiston and on the hillside to north of Clearwater River. It is proposed to tunnel into the hillside to bed rock, following course of small springs which appear on surface, and then by a system of side tunnels to concentrate flow of a number of springs into one stream. Incorporators: J. L. Chapman, Albert Davis, Chas. Mix and others.

Shelley, Idaho.—A committee is reported to have been appointed consisting of N. C. Mickelson, W. A. Hudson and H. Harrington to investigate and report on the question of constructing water works.

Middletown, Ill.—The City Council is reported to be considering the question of constructing water works.

Chicago, Ill.—Mayor Busse on Aug. 9 signed the supplemental contract by which the Rogers Park Water Co. is to sell its property to city for $300,000.

Chicago, Ill.—Bids will be received until Aug. 31, by John J. Hamberg, Comr. Pub. Wks., for furnishing and delivering to this city about 2,100 1-in. 1¼ in., 1½ in., 2 in., 3 in., 4 in., and 6 in. water meters.

Virden, Ill.—This city is considering the question of building water works to cost $50,000 and a sanitary sewer system with purification plant, to cost $100,000, for which Richard H. Phillips, Consulting Engr., Sec. Bldg., St. Louis, Mo., is preparing plans and estimates, and it is not likely that more than the main trunk sewer, costing $20,000 to $25,000, will be built this fall. Bond issue for water works will be submitted within a few weeks; sewers will be built under the special assessment plan.

Kewanna, Ind.—The Kewanna Water Co. is reported organized with a capital of $15,000 by L. O. Leasure, C. W. Snipp and others.

Milltown, Ind.—W. H. Roose, of Corydon, who recently secured franchise for water works at Milltown, writes that the proposed work will cost about $15,000. Contract will not be let for about 8 or 10 weeks.

Bartlettsville, Ind. Ter.—This city is reported to be considering the question of constructing municipal water works.

Wesley, Ia.—The City Clk. writes that the citizens voted Aug. 5 to construct water works. Oscar Nelson, Mayor.

Murray, Ky.—See "Power Plants, Gas and Electricity."

Bangor, Me.—W. I. Brown, Clk. Water Bd., writes that new bids will be received on Aug. 22 for coagulating basin, head house, including screening, coagulant and laboratory departments, complete with appurtenances. Engineer, Geo. W. Fuller, 170 Bway., New York, N. Y.

Boston, Mass.—The City officials are reported to be considering a plan of Wm. Jackson, City Egr., for the installation of a system of water mains from Charles River basin, for additional fire protection, etc. It is estimated that it would cost about $250,000 to install the service and pumping station.

Lynn, Mass.—Geo. I. Leland, City Engr., writes that the question of improving and increasing the water supply is being considered. W. S. Johnson, Consulting Engr., 101 Tremont St., Boston.

Pontiac, Mich.—H. C. Monroe, Supt. Water Wks., is stated to have prepared a report on improvements and extensions needed at this time, and estimates the cost at $110,552 to include 12 miles of 4, 6 and 8-in. mains to all outlying districts, a new pump, new boiler and 8 wells.

Graceville, Minn.—See "Power Plants, Gas and Electricity."

Jackson, Miss.—Bids will be received by the Mayor and Bd. Aldermen until Sept. 3 for $216,000 bonds for the purchase of the existing plant from the Light, Heat & Water Co. Ramsey Wharton, Mayor.

**Newton, Miss.*—The Town Council is reported to have awarded to Sperry & Lukins, of Artesia, N. M., contract at $1,200 for boring an artesian well for water works about to be constructed.

It is reported that contract will soon be let for the proposed water works. Engineer, N. A. Kramer, of Magnolia.

Washington, Mo.—This city has given the Washington Water & Light Co. notice of its desire to purchase its water system at the expiration of the water franchise in June, 1908. The city and company have agreed upon Wm. H. Bryan, Consulting Engr., of St. Louis, to make detailed inspection of plant, and report its physical condition, and appraise present cash value.

Wood River, Neb.—See "Power Plants, Gas and Electricity."

Beaver City, Neb.—The citizens are reported to have voted on Aug. 5 to issue bonds for water works.

**North Platte, Neb.*—The Secy. of the Interior at Washington, D. C. has executed the following contracts in connection with the earthwork on the distribution system for the North Platte irrigation project, Neb.-Wyo.: About 10 miles of laterals to the Burke Constr. Co., of Mitchell, Neb., involving the excavation of approximately 128,000 cu. yds. of material, $30,159; about 10 miles of laterals to Detrick, Rush & Hoth, of Bayard, Neb., involving 96,100 cu. yds. of excav., $16,703, and about 40 miles of laterals to M. E. Getter, of Mitchell, Neb., involving 230,100 cu. yds. of excav., $37,628.

Roswell, N. M.—Engineer C. F. Ellis is reported to have completed plans for water works, for which, it is stated, an election will be held in Sept; probable cost, $82,000.

Pleasantville, N. Y.—Bids are wanted by the Bd. of Water Comrs. until Aug. 26, for constructing storage reservoir with earth dam, masonry core wall, spillway, gate house and pipe conduit. Engineers, Byrne & Darling, Barrett Bldg., White Plains. W. S. Moore, Village Clk.

**Long Island City, L. I., N. Y.*—The following are the bids opened on Aug. 8 by the Comrs. of Parks, N. Y. City, for furnishing material and constructing a pumping plant in Forest Park, Boro. of Queens: Gus Hildebrand, $17,770; Jas. MacArthur, $12,500; Mellarg-Barton Co., $10,222 (awarded contract); and John Spence, Jr., $13,825.

Winston-Salem, N. C.—The citizens are reported to have voted Aug. 6 to issue $150,000 bonds for street improvements, sewerage system and water works.

Wahpeton, N. D.—All bids received on Aug. 5 by Wm. R. Purdon, City Aud., for constructing and placing boilers for the water works plant have been rejected and new bids will be received on Aug. 24. The boilers are to be for a 66-in. x 18-ft. boiler and a 72-in. x 18-ft. Separate bids on each boiler.

**Cincinnati, O.*—The Bd. of Pub. Service is reported to have on Aug. 9 awarded contract for water mains to U. S. Cast Iron Pipe Co. for $22,000.

Youngstown, O.—The Council has authorized a survey of the territory in Berlin Township looking to the construction of a dam to furnish Youngstown with an additional water supply.

**Cleveland, O.*—The Bd. of Pub. Service is reported to have on Aug. 9 awarded the contract for 5,000 water meters, with the privilege of increasing the order 10,000, to the Buffalo Meter Co., of Buffalo, N. Y.

Lima, O.—See "Power Plants, Gas and Electricity."

Oklahoma City, Okla.—Mayor Scales is reported to have authorized City Engr. Burke to prepare estimates for sewer and water extensions to cost about $325,000.

Bristol, Pa.—According to recent decision of Judge Stout, the Town Council has received authority to establish water works.

Sharon, Pa.—The City Council is reported to have under consideration the filtration of the water supply.

Lebanon, Pa.—State Health Comr. Dixon, at Harrisburg, is reported to have approved the proposed new source of supply for the city of Lebanon. It will be taken from Swatara Creek.

Mechanicsburg, Pa.—The Water Co. is reported to have decided to construct new reservoir, pumping station and filter plant.

Ft. Adams, R. I.—Capt. Willis C. Metcalf, Qm., U. S. A., 209 Thames St., Newport, writes that M. A. McCormick, 4 Sherman St., Newport, bid, on Aug. 5, for the construction of a 400,000 gal. reservoir, 3 shelters for springs and laying pipe from springs to reservoir at Sanderstown, R. I.; also laying pipe from reservoir to and across Narragansett Bay to a connection with reservoir at Ft. Grehle, Dutch Island, as follows: 3 spring shelters, $6,500; 1 reservoir (re-inforced concrete), $22,000; extra excav. per cu. yd., 45 cts.; extra concrete per cu. yd., $8; extra rubble masonry, per cu. yd., $4; land and submerged pipes, $49,000.

**Belle Fourche, S. D.*—The Secretary of the Interior at Washington, D. C., has executed contract with H. T. Adams, of Belle Fourche, for construction of Sec. 2, Schedule 1, of the laterals under the Belle Fourche irrigation project, to consist of 9 miles of ditch, and involving 54,050 cu. yds. excav., for $15,287; to J. E. Hilton, of Belle Fourche; for the construction of a portion of the south canal, involving 220,500 cu. yds. excav., $46,000, and to J. W. McNeel, of North Platte, Neb., for construction of about 10 miles of the Indian Creek lateral, involving 236,950 cu. yds. excav., $53,007.

Bonesteel, S. D.—Bids will be received until Aug. 20 (readvertisement) by M. P. Dowling, Town Clk., for constructing a complete system of water works.

Dickson, Tenn.—W. T. Turner, Mayor, writes that an election will be held Sept. 5 to vote on issuing bonds for water works.

Bardwell, Tex.—The Bardwell Water Co. is reported incorporated with a capital of $7,000 by W. S. Robertson, R. O. Roach, W. B. Whittington and others.

Dallas, Tex.—It is stated that bids are wanted until Aug. 20 for 250 tons 6-in. c. i. standard water main. D. F. Sullivan, Water Wks. and Sewerage Comr.

Ft. Worth, Tex.—The City Engineer is reported to be preparing plans for a filtration plant.

Crockett, Tex.—The City Council is reported to be considering the question of constructing water works.

Norfolk, Va.—Bids will be received until Sept. 14 at the office of the Bureau Yards and Docks, Navy Dept., Washington, D. C. (R. C. Hollyday, Ch.), for constructing a steel tank and tower, navy yard, Norolk, as per specification No. 1,557.

Seattle, Wash.—The City Council is reported to have passed a resolution, providing for a system of salt water mains in the business section of the city; estimated cost, $240,000.

Aberdeen, Wash.—The City Council is reported to be considering the question o securing an additional water supply.

Elkins, W. Va.—Bids are wanted until Sept. 5 for the purchase of $40,000 water and sewerage bonds, as advertised in The Engineering Record. Geo. Henry, City Clk.

Medford, Wis.—C. H. Phillips, of Marshfield, has prepared estimates for water works to cost $300,000. A special election will be called soon to vote on the issue of bonds.

Linden, Wis.—The citizens are reported to have voted to issue bonds for water works.

Prentice, Wis.—See "Power Plants, Gas and Electricity."

Fond du Lac, Wis.—At a recent meeting of Council a resolution is reported to have been passed, authorizing the City Clk to procure bids for pipe line to bring water supply from lake by gravity pressure.

Fond du Lac, Wis.—Bids will be received until Aug. 26 by the Bd. Pub. Wks. (L. A. Pettibone, Chmn.), for furnishing material and constructing a gravity water pipe line from Lake Winnebago to Reed St.

Thermopolis, Wyo.—We are informed that this city has in contemplation the construction of water works to cost about $75,000.

Massey Station, Ont.—The Ontario Ry. & Municipal Board is reported to have approved a bylaw providing for the issue of $10,000 bonds for the extension of the water works of Massey, Algoma Dist.

Sudbury, Ont.—The by-law providing for the extension of the water works and sewers of Sudbury is reported to have been approved by the Ontario Ry. & Municipal Board.

Amherthurg, Ont.—The citizens are reported to have voted to issue $2,500 bonds for water works improvements.

SEWERAGE AND SEWAGE DISPOSAL.

Notes Arranged Alphabetically by States.

Alamosa, Colo.—The City Clk. writes that B. D. Critchlow, of Alamosa, is making surveys and estimates for a sewerage system. As soon as completed bids will be asked.

Mullan, Idaho.—The question of constructing a sewerage system is reported to be under consideration.

Chicago, Ill.—Bids will be received until Aug. 31 by John J. Hamberg, Comr. Pub. Wks., for furnishing material and completing the construction of the Lawrence Ave. Pumping Station, on Lawrence, near Evanston Aves.; also completing the construction of an intake tunnel for Lawrence Ave. conduit at Lawrence Ave. and Lake Michigan being a portion of Sec. N, intercepting sewers.

Joliet, Ill.—H. A. Stevens, City Engr., writes that two sewer systems are being planned, one in the 7th ward, to cost about $15,000, the other in the 1st ward to cost $31,000. Contract will not be let until the spring.

Minook, Ill.—C. R. Denson, City Clk., writes that it is proposed to construct a sewerage system to cost about $25,000. The ordinance for the work has not yet been passed. Engineer, Wm. Meyer, of Minook.

Herrin, Ill.—Fred E. Roland, City Clk., writes that it is proposed to construct a sewerage system at a cost of $20,000. Engineer, W. T. Pierce, of Herrin.

Virden, Ill.—See "Water."

Sterling, Ill.—Local press reports state that the City Engr. is preparing estimates of cost of constructing the north end sewer system.

Indianapolis, Ind.—The Bd. of Pub. Wks. is reported to have adopted resolution providing for extension of the E. Michigan St. sewer in Michigan, St. Clair and 10th Sts.

Bloomfield, Ind.—All bids opened Aug. 8 for pipe, branches, junctions, manholes, etc. f. o. b. cars Bloomfield, and for construction complete with or without material or any part of same separate of main and minor sewers in a system of sewerage, etc., have been rejected and new bids will be received on Aug. 26. Engineer, Geo. Cadogan Morgan, 169 Jackson Boule., Chicago, Ill.; Chas. E. Coombs, Pres. Bd. Trus.

Richmond, Ind.—Fred. R. Charles, City Engr., writes that the city was unable to let contracts on Aug. 9 for work in this city and will again receive bids on Aug. 30 for the following, as the city is very anxious to let contracts for this work: A sewerage system 4 miles in length, and disposal plant, in the southwest part of city; probable cost, $50,000; also construction of subway on W. 2d St., and a sewer system in connection with same; probable cost, $40,000; also a street to be made, by grading and macadamizing 1,300 ft. in length, and a sewer in connection with same; probable cost of both, $9,000. Length of sewer, 1,116 ft. John F. Taggert, City Clk.

Muscatine, Ia.—Bids will be received until Aug. 26 by the City Council for constructing standard vitrified tile sewers in portions of several streets. Edw. H. Ruby, City Clk.

Clear Lake, Ia.—The question of constructing a sewerage system is reported under consideration here.

* *Items marked thus give the names of parties awarded contracts.*

Des Moines, Ia.—It is stated that bids will be received until Aug. 23 by the Bd. Pub. Wks. (W. W. Wise, Chmn.), for constructing sewers in Chester Boule.

Iowa City, Ia.—The City Engr. is reported to be preparing plans and specifications for new sewers.

Clinton, Ky.—John B. Evans is reported to have received franchise for sewers.

Alexandria, La.—Bids for the construction of approximately 5 miles of 8-in., 01-in., 12-in. and 14-in. vitr. pipe sewers and accessories will be received by the Mayor and Bd. of Aldermen until Sept. 3 (readvertisement) as advertised in The Engineering Record. Ira W. Sylvester, City Engr.

Lansing, Mich.—Roy Robb, of Mason, County Surveyor, is reported to be making preliminary surveys in East Lansing, with a view to constructing a sewerage and drainage system.

Fairmount, Minn.—Bids will be received until Aug. 26 by E. L. Lewis, City Clk., for constructing sewers in portions of Blue Earth Ave., 1st, 4th, and Park Sts. A. Marston, Engr., Ames, Ia.

Lamberton, Minn.—The question of issuing bonds for the construction of a sewerage system is reported under consideration.

**Morris, Minn.*—C. B. Burpee, City Clk., writes that the contract for constructing sewers in Dists. 4, 5, 8, 9 and 20 (bids opened Aug. 6) has been awarded to Tanner Bros., of Morris, for $6,800.

Independence, Mo.—The City Council is reported to have passed an ordinance providing for an appropriation of $11,000 for improving the septic sewerage system on the east and west sides of city. R. T. Procter, City Engr.

Kansas City, Mo.—Bids will be received until Aug. 22 by the Bd. Pub. Wks., for constructing Joint Dist. Sewers in Div. No. 3. E. A. Harper, City Engr.

Nevada, Mo.—It is reported that bids will be received by S. L. Higgins, City Clk., until Aug. 20, for constructing Dist. Sewer, No. 14.

Aurora, Neb.—Dennis Saylor, City Clk., writes that the citizens on July 30 voted to issue $10,500 bonds for the construction of a sewerage system. Engineer, A. A. Hartquest, of Auroa, assisted by H. C. Gardner, of Lincoln.

Columbus, Neb.—Andrew Rosewater, of Omaha, is stated to have completed report for a sewerage system for Columbus, which he estimates at $14,500.

New Brunswick, N. J.—See "Paving and Road-making."

Trenton, N. J.—Bids will be received until Aug. 20 by the Common Council for constructing sewers in Stuyvesant and Beechwood Aves.; also a drain in Princeton Ave. Harry B. Salter, City Clk.

South Orange, N. J.—The citizens of South Orange Township are reported to have voted to authorize the Township Com. to issue bonds for $35,000, the proceeds to be used to purchase from the township of Millburn, 25 per cent. of its capacity in the joint trunk sewer.

Wildwood, N. J.—Bids will be received until Aug. 20 by the Boro. Street Com. (Evans G. Slaughter, Chmn.), for reconstructing about 12,000 lin. ft. of the sewerage system of the Boro. L. M. Rice, Boro. Engr.

Ft. Lee, N. J.—The Boro. Council is reported to have authorized Engineer Eckerson to prepare plans and specifications for the Deadbrook sewer, to take in the Edgewater system and sewers east and west on Main St. This is the first work to be done on the proposed sewerage system.

Medina, N. Y.—W. B. Eckert, Village Clk., writes that Fred K. Wing, of Buffalo, is preparing plans for pipe sewers to cost about $12,000.

Brooklyn, N. Y.—Bids will be received until Aug. 28 by Bird S. Coler, Boro. Pres., or furnishing material and constructing sewer in Scott Ave., portion of Section I. Engineer's estimate: 2,946 lin. ft. 180-in. circular sewer, 106 lin. ft. 180-in. horseshoe sewer, 174 lin. ft. drop section, 19 lin. ft. connecting section, 745 lin. ft. 48-in. sewer, 470 lin. ft. 15-in. and 5,600 lin. ft. 12-in. pipe sewer, 1,000 lin. ft. 12-in. pipe sub-drain, 1,100 lin. ft. 12-in. temporary drain pipe, 1 manhole, Class "A," 6 Class "B," 4 Class "C," 3 Class "D," 6 Class "E," 1 Class "F," 74 manholes on pipe sewers. 12 sewer basins, reconnected, 680 M ft. sheeting and bracing, 100 M ft. foundation plank, 5 cu. yds. Class "A," and 1,000 cu. yds. Class "B" concrete. Security, $175,000.

Troy, N. Y.—Bids will be received until Aug. 23 by the Bd. Contract and Supply (Jas. M. Riley, Clk.) for furnishing material and constructing a sewer of 20-in. salt-glazed vitr. drain pipe in a portion of Stone and Deirfreist Ave.

New York, N. Y.—Wm. G. Leeson, 537 W. 149th St., bid on Aug. 6 for furnishing material and building sewer and appurtenances in Sherman Ave., Isham and Emerson Sts., Manhattan Boro., as follows: 938 lin. ft. brick sewer 3x6 in. x 2 ft. 4 in., $7; 402 lin. ft. brick sewer 3 ft. 6 in. x 2 ft. 4 in., $6; 1,760 lin. ft. salt-glazed 15-in. vitr. stoneware pipe sewer, $5.70; 135 lin. ft. salt-glazed 12-in. vitr. stoneware pipe culvert, $1; 6 receiving basins, ea., $175; 570 cu. yds. rock excav., $2.25, and 528 M ft. timber and plank for foundation, $35; total, $21,662.

The lowest bid opened on Aug. 12 at the office of the President of Manhattan Boro. for furnishing material and reconstructing outlet sewers and appurtenances, overflows and connections at 42d and 43d Sts., North River, and 42d and 43d Sts., bet. North River and 11th Ave., was submitted by Robt. J. Rooney, at the following bid: 1,350 lin. ft. wooden barrel sewer 4 ft. 6 in. $17; 10 lin. ft. twin brick sewers 4 ft. 6 in., $50; 45 lin. ft. brick sewer 4 ft. 6 in. x 9 ft., $40; 196 lin. ft. brick sewer, 4 ft. 6 in. x 9 ft., $40; 60 lin. ft. overflow chamber brick sewer of varying diam., $40; 170 lin. ft. brick sewer 6 ft. 6 in. x 9 ft., $40; 70 lin. ft. twin brick overflow sewers 8 ft. x 2 ft., $35; 50 lin. ft. twin brick overflow sewer 8 ft. x 2 ft., $35; 206 lin. ft. brick sewer 4 ft. x 2 ft. 8 in., $20; 123 lin. ft. brick sewer 4 ft. x 2 ft. 8 in., $20; 90 lin. ft. salt glazed vitr. stoneware pipe culvert 12 in., $4; 4 receiving basins circular, ea., $250; 15 cu. yds. old rock masry., $5; 50 M ft. timber and plank for bracing and sheet piling, $25; 50 M ft. timber and plank for approaches, $20; total, $56,755. Totals of other bids: Atlanta Constr. Co., $64,332, and Jos. Moore, $58,180.

Castile, N. Y.—W. J. White, 159 Dearborn St., Buffalo, is reported to be completing plans for a sewerage system.

Lancaster, N. Y.—The State Bd. of Health at Albany is reported to have approved the plans of Joos & Gatchell, Prudential Bldg., Buffalo, for a sewerage system and disposal plant.

Winston-Salem, N. C.—See "Water."

**Minot, N. D.*—The City Council is reported to have, on Aug. 9, accepted the bid of Illstrup & Olson, of Minneapolis, Minn., for constructing the sewerage system for $19,096.

Canton, O.—Bids will be received until Sept. 3 for sewers, to cost about $9,945, as advertised in The Engineering Record. W. E. Sarver, City Engr.

Youngstown, O.—Bids will be received until Aug. 30 by the Bd. Pub. Service (W. H. M. Mullin, Clk.) for furnishing material and constructing sewers in a portion of Falls Ave.

Canal Dover, O.—It is reported that bids will be received by the City Clk., until Aug. 31, for sewers to cost about $18,037.

Portsmouth, O.—It is stated that bids will be received until Aug. 22 by Filmore Musser, City Aud., for $10,000 sanitary sewer bonds.

Toledo, O.—Breyman Bros. & McNeil, of Toledo, are reported to have submitted the lowest bid on Aug. 5 for the Parkwood sewer, known as Sewer No. 999, over 2 miles long, 6 ft. diam. at mouth and 24 in. diam. at end, for $12.75 per ft.

Akron, O.—The lowest bid recently received for the trunk sewer west of Portage Path and the filter beds is reported to have been submitted by Dan O'Mara, 545 W. Market St., for $12,650.

Ironton O.—An election will be held on Sept. 5 to vote on issuing $45,000 bonds for sewers.

Oklahoma City, Okla.—See "Water."

**Philadelphia, Pa.*—We are informed that the following are the totals of bids opened on July 22 by the Dept. of Pub. Wks. for sewers to be constructed in connection with the work of abolishment of grade crossings on the P. G. & N. and Richmond Branch of the Philadelphia & Reading Ry. (Geo. S. Webster is Ch. Engr. Bureau of Surveys.) (*a*) Contract 101, P. G. & N. Elevated; (*b*) Contract 102, P. G. & N. Elevated; (*c*) Contract 103, P. G. & N. Elevated; (*d*) Contract 104, P. G. & N. Elevated; (*e*) Contract 105, P. G. & N. Elevated; (*f*) Contract 106, Richmond Branch Elevated; (*g*) Contract 107, Richmond Branch Elevated. Millard Constr. Co., *a* $32,862, *b* $39,685, *c* $45,957, *d* $75,204, *e* $39,763, *f* $33,437, *g* $45,463; Mack Paving Co., *a* $56,027, *b* $51,144, *c* $85,572, *d* $125,530, *e* $60,302, *f* $63,440, *g* $92,007; David Peoples, *a* $37,251, *b* $41,403, *c* $60,256, *d* $100,006, *e* $55,840, *f* $36,304, *g* $46,412; R. P. Bennis, *d* $92,600, *e* $41,082; Michael O'Rourke, *f* $45,152, *g* $61,568; David McMahon, *a* $41,175, *b* $35,452, *c* $51,127; Robt. Higgins, *a* $48,512, *b* $39,222, *c* $57,934; M. & J. B. McHugh, *a* $42,876, *b* $43,202, *c* $65,260, *g* $57,408; McGaw & Gray, *a* $55,096, *b* $56,350, *c* $87,902, *e* $65,239; Lombardic & Pascuzzie, *b* $42,610, *g* $60,235; John McMenamy, *c* $104,858, *f* $50,840, *g* $77,287; Robert P. Ryan, *a* $43,766, *b* $50,595, *f* $62,305, *g* $76,557. Millard Constr. Co. secured contracts for Contracts 101, 103, 104 and 105, and David McMahon for Contract 102.

Philadelphia, Pa.—The B'd. of City Surveyors on Aug. 12 approved plans for the construction of main sewers and extensions at an aggregate cost of about $221,000, as follows: Thomas Run (extension), reconstruction of Market St. sewer east of 36th; extensions of the Wissahickon low level intercepting sewer and the Wissahickon high level cut-off sewer; extension of Bingham sewer; extension of Jackson St. sewer; 12th St. sewer, 9th St. and reconstruction of the Pine St. sewer. Plans for construction of several branch sewers estimated to cost in all about $100,000. Contracts for all the work will probably be let by Geo. R. Stearns, Dir. Dept. Pub. Wks., next month.

Wilkesbarre Pa.—Plans for a sewer to be constructed on Union St., from N. Pennsylvania Ave. to river, have been prepared by B. K. Finch, Engr. of Sewers of City, and have been submitted to the Lehigh Valley R. R. Co. for consideration. The plans call for a sewer of either reinforced concrete or brick 7 ft. in diam., large enough to carry away all surface water of that section; probable cost, $100,000. Alfred Hand is City Engr.

West Middlesex, Pa.—Griffith Nicholas, of Sharon, is reported to be preparing plans for a sewage disposal plant.

Reading, Pa.—The Finance Com. on Aug. 5 reported favorably the bill, providing for a loan of $40,000 for building sewer and making other improvements.

Lesterville, S. D.—The Town Council is reported to be considering the question of constructing a sewerage system.

Bryant, S. D.—F. R. Shepherd, City Aud., writes that bids will be received on Sept. 9 for the construction of a drainage and sewerage system. Engineer, J. M. Raymond, of Raymond, S. D.

**Waco, Tex.*—Chas. Derr, of Oklahoma City, Okla., is reported to have secured the contract for extending the sanitary sewerage system of Waco for about $50,000.

Seattle, Wash.—The City Council has passed the ordinance providing for the construction of the North Trunk sewer, which will cost about $3,500,000. It will drain nearly all the city north of Madison St., and property in vicinity of Lake Washington as far south as Yeser Way.

Centralia Wash.—The citizens are reported to have voted on July 30 to issue $22,500 bonds for the construction of a trunk sewer.

Elkins, W. Va.—See "Water."

**Wausau, Wis.*—Miller & Krause, of Wausau, and Carl Lotz, of Wausau, are reported to have secured contracts for constructing sewers on Aug. 4 at $6,700 and $7,900 respectively.

**North Milwaukee, Wis.*—The contract for laying 15,300 ft. of vitr. pipe sewers has been awarded to F. E. Kaminski, of Berlin, at the following prices: 6-in. pipe, 50 cents; 8-in., 63 cts.; 10-in., 75 cts., and 15-in., 95 cts; manholes, $37; total cost, $11,950.

Fernie, B. C.—Bids will be received by J. W. Nunn, City Clk., until Aug. 23 for the construction of a covered concrete septic tank 100 ft. long x 30 ft. wide, as advertised in The Engineering Record. Robt. Potter, City Engr.

Sudbury, Ont.—See "Water."

BRIDGES.

Notes Arranged Alphabetically by States.

Ingot, Cal.—It is stated that bids are wanted by the Bd. of Superv., (S. N. Witherow, Clk.) until Sept. 3, for constructing stringer and truss bridge across Cow Creek at Ingot.

Sacramento, Cal.—Bids are reported to have been opened by the Bd. of Super. on July 25 for the Fairoaks Bridge across the American River, near Fairoaks, as folows: E. E. Berry, Sacramento, $100,000. James McGilvray and E. O. Birge, Sacramento, $98,000. Cotton Bros. & Co., Oakland, $97,600. C. J. Matthews, Sacramento, $94,500. Midland Bridge Co., Kansas City, $93,970. Healy, Tibbitts Constr. Co., San Francisco, $92,970. San Francisco Bridge Co., San Francisco, $89,760. Pacific Constr. Co., San Francisco, $89,357. Burrell Bridge & Constr. Co., Oakland, $88,973. Clark & Henry Constr. Co., Sacramento, $88,400. Murvy, Elwell Co., San Francisco, $85,300. Hyde, Harjes & Co., Oakland, $85,000. Western Bridge & Constr. Co., Omaha, Neb., $84,933.

The lowest bid opened July 31 for constructing the Bridge House Bridge is reported to have been submitted by the Western Bridge & Constr. Co., at $18,800.

**Woodland, Cal.*—C. F. Hadsall, Co. Clk., writes that the following are the bids opened on Aug. 1 for constructing a reinforced concrete bridge across Putah Creek, consisting of three 115-ft. spans: W. N. Concanon, Fairfield, $46,903 (awarded contract); F. P. Smith & Bro. & W. S. C. Stevens, Davisville, $54,669; Pacific Constr. Co., San Francisco, $47,793, and Healy-Tibbits Constr. Co., San Francisco, $39,866.

Denver, Colo.—At a meeting held at the Mayor's office on Aug. 3 the engineers of the several rairoads entering Denver from the north and east, it was agreed that the railroad companies construct a viaduct over the tracks at 19th and Wazee Sts. to North Denver at a cost of $400,000.

**Brookland, D. C.*—Bids were opened on Aug. 10 by the Comrs. D. C. at Washington for the construction of a concrete-steel bridge across track of the Baltimore & Ohio R. R. Co. on line of Monroe St., Brookland, D. C., and C. B. Clark & Co., 10 E. Lexington St., Baltimore, Md., secured the contract for same as follows: Excavation, $1 per cu. yd.; foundation concrete, $7 per cu. yd.; concrete above foundation, $8 per cu. yd.; structural steel, 5 cts. per lb., and steel reinforcement, 3 cts. per lb.; total cost, $28,480. Totals of other bids: Penn Bridge Co., Beaver Falls, Pa., $32,744, and Jas. J. Overn, 335 Delaware Ave., N. E., Washington, D. C., $31,000.

Pensacola, Fla.—See "Railroads."

Chicago, Ill.—Bids will be received until Aug. 20 by John J. Hanberg, Comr. Pub. Wks., for furnishing material and constructing the new sub-structure and superstructure for a temporary highway bridge over the north branch of the Chicago River, near Kinzie St.

**East St. Louis, Ill.*—W. J. Crocken, City Engr. writes that bids were opened on Aug. 1 by the Bd. of Local Improv. for rebuilding Broadway viaduct over Cohakia Creek, and the lowest and successful bid was submitted by the Rude Eng. Co., of East St. Louis, at the following bid: 1,160 cu. yds. excav., $3; 560 cu. yds. concrete in piers, $12.50; 500 cu. yds. concrete in roadway, $10; 700,000 lbs. steel work, per hundred lbs., $5; 6,000 sq. ft. brick paving, 20 cts.; 20 M ft. flooring, $35, and painting entire structure (lump sum), $300; total, $52,680. Totals of other bids received: Union Bridge & Constr. Co., Kansas City, Mo., $53,175; Pan American Bridge Co., New Castle, Ind., $63,704, and Wright-Gallagher Constr. Co., St. Louis, Mo., $55,748.

Terra Haute, Ind.—It is reported that bids will be renewed by the Co. Comrs. until Aug. 24, for constructing Fletcher Chappel bridge, of concrete, steel reinforced, with 35-ft. span. Jerome W. Denehie, Co. Aud.

Lafayette, Ind.—The County Comrs. are reported to have ordered plans and will soon ask for bids for the construction of a bridge across the Wabash River at Grandville; estimated cost, $50,000.

**Indianapolis Ind.*—The County Comrs. are stated to have awarded Aug. 7 the contract for constructing a bridge over Crooked Creek in Washington Township to Geo. W. Fife, for $7,170.

**Atchison, Kan.*—Edw. Iverson, Co. Clk., writes that the contract for constructing bridge on line between Atchison and Jefferson Counties (bids opened Aug. 6), has been awarded to Missouri Valley Bridge & Iron Co., of Leavenworth, for $5,175.

Byers, Chmn.) for furnishing material and constructing vitrified repressed brick block on macadam foundation portions of Washington and Bever Aves., 8th and 5th Sts.; also a portion of 13th St. with vitrified brick block on a 4-in. sand cushion.

Iowa City, Ia.—It is reported that bids are wanted by City Council until Aug. 21 for brick pavement on about 13 blocks and macadam on one block; probable cost, $40,000.

Waterloo, Ia.—The City Council is reported to have rejected all bids opened July 31 for paving streets on the east and west sides. According to reports new bids will be received Aug. 26. C. T. Wilson, City Engr.

Des Moines, Ia.—Bids were opened on Aug. 7 by the Bd. of Pub. Wks. for paving as follows: 6th Ave., repressed paving brick on 6-in. Portland cement foundation and asphalt fill, 4,160 sq. yds.; Jas. Campbell bid for this work $2.38; Forest Ave., vitr. paving block on 6-in. natural cement concrete foundation, $19,450 sq. yds., 2 bids, Cook Constr. Co. and Jas. Herribin, they each bid $1.07 per sq. yd., and for paving W. 54th St. with creosoted wood block on 6-in. Portland cement foundation, 4,558 sq. yds., O. P. Herrick received contract for this at $2.369 per sq. yd.

Lake Charles, La.—Bids will be received until Sept. 3 for the construction of about 15 miles of cement sidewalks, and brick or cement curb, as advertised in The Engineering Record.

Hingham, Mass.—The lowest bid opened on Aug. 6 by the State Highway Comn. at Boston, for state highway work at Hingham was submitted by the Lane Quarry Co., of Hingham, for $4,394.

**Lansing, Mich.*—Farrell Bros & Algate are stated to have secured the contract for paving Saginaw St. with Saginaw block, for $21,550.

**St. Paul, Minn.*—The Bd. of Pub. Wks., on Aug. 8, awarded contract for curbing, leveling, filling and sodding Capitol Ave., from Hamline Ave. to Aldine St., to Jas. Forrestal, Scandinavian American Bank Bldg., for $6,976.

Fulton, Mo.—It is stated that bids are wanted by W. R. Pemberton, City Clk., until Aug. 20, for laying about 7,000 sq. yds. vitr. paving, curb., etc.

**Great Falls, Mont.*—The Kettle Rivers Quarries Co., of Minneapolis, Minn., has secured the contract for paving Central Ave. with 3½-in. creosoted wood block on concrete foundation as follows: Creosoted block, $3.09 per sq. yd; 5½-in. concrete base, $6.50 per cu. yd.; filler course, repairs to old concrete base, $8.50 per sq. yd.; concrete headder or marginal blocks or stops, 37 cts. per ft., compacted earth fill in old trenches, 60 cts. per cu. yd.

Riverton, N. J.—F. J. Brown, Mayor, writes that all bids opened on Aug. 8 for 30,000 sq. ft. cement paving have been rejected, and it has not yet been decided when new bids will be received. E. H. Pancoast, Chmn. Highway Com.

Bayonne, N. J.—Bids will be received by the City Council until Aug. 20 for furnishing material and paving 41st St., from Ave. C to Ave. E, with asphalt, about 4,290 sq. yds., with concrete curb and gutter, as advertised in The Engineering Record. W. C. Hamilton, City Clk.; F. W. Dalrymple, City Surveyor.

Wildwood, N. J.—Bids will be received until Aug. 20 by the Boro. Street Com. (Evans G. Slaughter, Chmn.), for constructing about 40,000 sq. yds. of macadam streets with cement gutters. L. M. Rice, Boro. Engr.

Somers Point, N. J.—All bids opened on Aug. 5 for laying macadam pavement on the numerous streets or avenues to consist of 11,928 sq. yds. macadam, 6,285 lin. ft. new blue stone curb, 1,365 lin. ft. curb reset and 56 lin. ft. radius curb; also the bids opened same time for grading and graveling Harbor Lane, and building a bulkhead or wharf on Harbor Lane, in the city of Somers Point, have both been rejected and new bids will be received by Jas. E. Scull, City Clk., at Somers Point until Aug. 19. Engineer E. D. Rightmire, of Atlantic City.

**Newark, N. J.*—B. M. Shanley Sons Co., 859 Broad St., is reported to have secured the contract for constructing 18,000 sq. yds. of roadway in Weequahic Park, for $15,480.

**New Brunswick, N. J.*—Abraham Jelin has secured the contract for paving French St. with Mack blocks, about 4,100 sq. yds., at $2.65 per sq. yd.; also the 10-in. terra cotta sewer on Wyckoff St., at 80 cts. per lin. ft.

Camden, N. J.—The construction of a road to connect Camden and Cape May is reported decided upon by the Cumberland County Bd. Freeholders at a cost of about $15,000.

Hempstead, L. I., N. Y.—See "Bridges."

New York, N. Y.—Bids were opened on Aug. 6 by Louis F. Haffen, Pres. Bronx Boro., for paving as follows: Clay Ave., from E. 166th St. to Wendover Ave.; (*a*) 18,330 sq. yds. iron slag block pavt., (*b*) 2,760 cu. yds. concrete, (*c*) 8,250 lin. ft. old curb, (*d*) total: Sicilian Asphalt Paving Co., *a*, $3.25; *b*, $6; *c*, 40 cts.; d, $79,432; Asphalt Constr. Co., *a*, $2.75; *b*, $4.75; *c*, 40 cts.; *d*, $66,817.

Lowest bid for paving Hunt's Point Ave., from Southern Boule. to Lafayette Ave., was submitted by the Barber Asphalt Paving Co. at the following bid: 12,700 sq. yds. asphalt block pavt., $1.70; 1,850 cu. yds. concrete, $5.50; 3,450 lin. ft. new curb, 97 cts., and 100 lin. ft. old curb, 32 cts.; total, $35,143. Totals of other bids: Asphalt Constr. Co., $36,692; Hastings Pavt. Co., $36,106, and Continental Asphalt Paving Co., $37,643.

The Barber Asphalt Paving Co. submitted lowest bids on Aug. 6 for paving with asphalt Timpson Pl. at $5,155, and Grant Ave. at $9,283.

W. F. Murray submitted lowest bid on Aug. 6 for regulating, grading, laying new flag, etc., on E. 199th St. at $17,922.

Brooklyn, N. Y.—The lowest bid opened on Aug. 8 by the Comrs. of Parks, N. Y. City, for furnishing materials and constructing cement sidewalk and curb around Parade Ground, Prospect Park, Boro. of Brooklyn, was submitted by Bonacci & Vincelli Constr. Co., 672 DeGraw St., as follows: 40,622 sq. ft. cement walk, 15 cts.; 4,145 lin. ft. cement curb, 40 cts.; 2,000 cu. yds. top soil, 78 cts.; total, $9,311.

The following are the bids opened on Aug. 8 by the Comrs. of Parks, N. Y. City, for furnishing materials and constructing asphalt tile walks on sand foundation in parks, Boro. of Brooklyn, as follows: (*a*), Winthrop Park, 74,000 sq. ft; (*b*), Cooper Park, 40,000 sq. ft.; (*c*), Seaside Park, 51,000 sq. ft.; (*d*), total cost of work: Continental Asphalt Paving Co., *a*, *b* and *c*, 26¾ cts.; *d*, $44,137; Hastings Pavt. Co., *a* and *b*, 24 cts.; *c*, 24¼ cts.; *d*, $39,727.

Albany, N. Y.—Bids will be received by Fred. Skene, State Engr. and Surveyor, until Sept. 3 for improving public highways Nos. 236 to 396, until Sept. 4 for roads Nos. 399 to 527 and until Sept. 5 for Roads Nos. 523 to 656, as advertised in The Engineering Record.

**Binghamton, N. Y.*—Arthur D. Osborn is reported to have secured the contract for paving with brick Chenango St. at $1.99 per sq. yd.

Mt. Vernon, N. Y.—Press reports state that bids are wanted until Aug. 20 for $25,000 highway improvement bonds.

Winston-Salem, N. C.—See "Water."

Elizabeth City, N. C.—Bids will be received until Sept. 2 by R. T. Whitehurst, City Clk., for $30,000 bonds to be issued for the purpose of general street improvements, and $20,000 for stone curbing.

Canton, O.—Bids will be received until Sept. 3 for about 42,000 sq. yds. vit. block paving, as advertised in The Engineering Record. Probable cost, $80,425. W. E. Sarver, City Engr.

**Toledo, O.*—Jas. Sheehan is reported to have secured the contract for paving with brick Summit Ave. at $58,415.

Dillonvale, O.—It is stated that bids will be received by the Village Council until Aug. 23 for paving sundry streets and an alley with hard burnt paving block or brick; Ross Blazer, Village Clk.

Woodsfield, O.—It is stated that bids will be received until Aug. 30 by Geo. P. Door, Village Clg., for grading, draining and macadamizing a portion of W. Court St.

Portsmouth, O.—It is stated that bids are wanted until Aug. 22 for $52,750 street improvement bonds. Fillmore Musser, City Aud.

St. Bernard, O.—Bids will be received until Sept. 3 by Geo. Schroeder, Village Clk., for constructing

* *Items marked thus give the names of parties awarded contracts.*

artificial stone sidewalks for portions of Church St., Bank and Sullivan Aves.

Guthrie, Okla.—Bids will be received on Aug. 22 for 10 blocks of paving on Cleveland Ave. Bids are wanted on two-course brick or blocks, and one-course brick or block and on asphalt. W. W. Miller, City Engr.

Ashland, Ore.—M. F. Eggleston, City Recorder, writes that no bids were received on July 30 for 16,860 sq. yds. macadam. New bids will probably be called for by City Council.

Reading, Pa.—Bids will be received until Aug. 23, by Elmer H. Beard, City Clk., for furnishing material and paving portions of several streets.

Ridgway, Pa.—Bids will be received by Geo. F. Greiner, Boro. Clk., until Aug. 31, for improving W. Main St., the work to include 2,000 cu. yds. excav.; 8,100 sq. yds. brick pav. on concrete foundation; 6,200 lin. ft. curb; 700 cu. yds. masonry; 575 cu. yds. concrete found., etc.

Lebanon, Pa.—Geo. B. Stucker, of Harrisburg, is reported to have submitted the lowest bid for 23,000 ft. state highway in Mill Creek Township, at $37,000.

**Sharon, Pa.*—The contract for paving 2,800 sq. yds. with asphalt block on Ormond Ave. is reported to have been awarded to Wm. McIntyre & Sons at $2.13 per sq. yd.

Jacksboro, Tenn.—It is stated that the Bd. Co. Rd. Comrs. (R. B. Bard, Chmn.), will receive bids until Sept. 3 for road construction.

Oshkosh, Wis.—It is stated that the Bd. Pub. Wks. (W. A. Marden, Chmn.) will receive bids until Aug. 24 for constructing tar macadam roadways for several streets.

POWER PLANTS, GAS AND ELECTRICITY.

Notes Arranged Alphabetically by States.

Safford, Ariz.—The question of constructing water works and an electric light plant is reported under consideration.

Hot Springs, Ark.—The City Council has granted to Atwood Benton, representing the Consumers' Electric Co., a franchise for an electric light plant to be completed within a year; probable cost of plant, $135,000.

Russellville, Ark.—See "Electric Railways."

Washington, D. C.—Bids will be received by the Bureau of Supplies and Accounts, Navy Dept., Washington, D. C., until Sept. 3, to furnish at the navy yards and naval stations the following supplies: Mare Island, Cal., Sch. 144—Annealing furnace. Sch. 190—Oregon pine, redwood, lumber. Sch. 191—Soil pipe, pipe fittings, radiators and valves, plumbing fixtures. Sch. 192.—Incandescent lamps, electric fixtures, mastic roofing, brick, etc., locomotive boiler. Sch. 194—Spikes, differential blocks, hack-saw blades, etc., drills, machinists' sets, pipe sets. Sch. 195—Rolled bronze, brass rod, sheet brass, lead and steel, ingot copper, bar iron, slab and sheet zinc. Sch. 198—Brass and steel pipe, pipe fittings, etc. Puget Sound, Wash., Sch. 189—Creosoted piles, plumbing fixtures, gate valves, expansion traps. Sch. 201—Incandescent lamps, electrical fittings, fir lumber; also until Aug. 20 as follows: Portsmouth, N. H., Sch. 167—Portland cement, sand, steam pipe, pipe fittings, valves, asbestos pipe covering. Boston, Mass., Sch. 178—Mandrels for lathe, valve reseating machine, etc. Newport, R. I., Sch. 168—Motors. Sch. 181—Battery cells. New York, N. Y., Sch. 143—Wireless telegraph apparatus. Sch. 169—Insulators, porcelain tubes, resistances, dry cells, etc. Sch. 170—Hydrometers, iron pipe, pipe fittings., sewer pipe, plumbing fixtures. Sch. 171—Yellow pine, doors, etc. Sch. 172—Asbestos roofing, steel tower. Sch. 177—Water meters. Sch. 181—Portable voltmeters and ammeters. Sch. 182—Direct differential blocks, sewer pipe. Sch. 183—White ash, white cedar, white pine, spruce, yellow pine. Sch. 184—Sheet brass, steel beams. Annapolis, Md., Sch. 178—Duplex and boiler feed pumps, tools, etc. Sch. 179—Electrical instruments, fuel saving recorder. Sch. 180—Portland cement, bricks, gravel, etc. Sch. 181—Copper conductor, etc. Sch. 182—Brass and iron gate valves, etc. League Island, Pa. Sch. 168—Electric panel boards. Sch. 183—White oak. Washington, D. C., Sch. 167—Steel, piles, yellow pine. Sch. 173—Motor, starting panel, circuit breaker. Sch. 174—Steel-wire rope, steel forgings. Sch. 175—White and yellow pine. Sch. 182—Corundum stones, etc. Sch. 184—Tool steel. Norfolk, Va., Sch. 167—Radiators, radiator valves. Sch. 182—Brass pipe. Sch. 187—Portland cement. Applications for proposals should designate the schedules desired by number. E. B. Rogers, Paymaster Genl., U. S. A.

Aurora, Ill.—The City Council is reported to have under consideration the improving of the electric light plant.

Greenfield, Ill.—The City Council is reported to have granted A. Y. Collins a franchise for an electric light plant.

Trenton, Ill.—Bids will be received until Aug. 27 for furnishing and erecting addition to building, engine, dynamo, switchboard, heater, boiler feed pump, piping and pole line material, for extending present direct-current, 3-wire lighting system. Specifications are on file at office of Newton Rule, City Clk., at Trenton, and at the office of the Engineer, W. A. Fuller, 1122 Chemical Bldg., St. Louis, Mo.

Indianapolis, Ind.—It is reported that the Bd. Trus. Woman's Prison (Faunce McKee, Pres.), will receive bids at the office of R. P. Daggett, archt., 804 Lemcke Bldg., until Aug. 28 for the installation of a heating and lighting plant in the Woman's Prison.

Hazelton, Ind.—C. L. Howard, City Clk., writes that a petition is being circulated for an election to vote on the construction of an electric light plant.

Evansville, Ind.—The Evansville Gas & Electric Light Co. is reported to be considering the placing of its wires underground.

Clay City, Ind.—The City Council is reported to be considering the question of constructing a municipal electric light plant.

Rockwell City, Ia.—F. S. Moore is reported to have purchased the electric light plant and will improve same.

Webster City, Ia.—The City Council is reported contemplating adding an engine and dynamo to the electric plant.

Murray, Ky.—W. O. Wear, City Clk., writes that bids will be received on Aug. 23 for the purchase of $20,000 bonds for water and electric light improvement.

Williamsburg, Ky.—The Williamsburg Electric Light Co. is reported incorporated with a capital of $5,000 by E. E., L. A. and Lida Nelson, all of Williamsburg.

Portland, Me.—Bids will be received until Sept. 3 by the Bd. Co. Comrs. (Jas. H. McDonald, Chmn.), for the engine, generator and electric wiring for the County Building. Geo. Burnham, archt., 120 Exchange St.

Gardner, Mass.—The Gardner Electric Light Co. has petitioned the Gas Comrs. at Boston, to issue $35,000 additional capital stock and $65,000 bonds for payment of floating debt and extension of plant and service.

East Orange, N. J.—Bids will be received until Aug. 26 by Arthur A. Richmond, Chmn. Com. on Bldgs., Bd. Educ., for erecting the Lincoln School, cor. Central and Maple Aves.

Newark, N. J.—Bids for furnishing material and erecting the following school house additions will be received by the Com. on School Houses (R. D. Argue, Secy.) Bd. Educ., until Aug. 23, Belmont Ave School; Archts., Hurd & Sutton, Union Bldg. Consulting Engr., Percy B. Taylor, 800 Broad St. Bergen St. School: Archt., Alfred Peter, 238 Washington St. Consulting Engr., Percy B Taylor, 800 Broad St. Bids may be submitted on the following as a whole or separately, except for steam heating and air moving apparatus, which must be bid on separately: Mason and fireproofing work, iron work, carpentering, plumbing, roofing and cornice work, electrical work, steam heating, air moving apparatus, etc.

Newark, N. J.—It is stated that Kitchell & O'Rourke, Scheurer Bldg., will prepare new plans for the Lincoln School to be erected in Richelieu Terrace; appropriation available, $80,000.

Bayonne, N. J.—Bids were opened Aug. 8, according to reports, by the Bd. Educ. as follows for erecting School No. 9, Calumet Constr. Co., $121,742, and the O Leary Co., $118,500. Plumbing and heating: Jahning & Peoples, $10,434; Knight & Burns, $10,550; Storm & Co., $10,334.

Westfield, N. J.—The erection of an 8-room addition to the Walnut St. School is reported contemplated.

Springville, N. Y.—At the annual school meeting it was voted to erect a school costing $75,000.

Lockport, N. Y.—The Bd. of Educ., it is stated, has rejected all bids received Aug. 1 for reconstructing the High St. School. J. E. Jeroleman, of Niagara Falls, is the archt.

Rochester, N. Y.—Bids will be received until Aug. 22 by the Bd. Educ. (J. S. Mullan, Secy.), for removing the 2 present boilers at No. 4 School, Jefferson Ave. and furnishing and setting up 2 horizontal tubular steam boilers for 100 lbs. pressure.

Roxboro, N. C.—Bids are wanted until Aug. 26 for $20,000 graded school bonds. Address Wm. D. Merritt, attorney.

Rowland, N. C.—McMillen & Cooper, of Wilmington, are reported to have prepared plans for a school to cost about $11,000.

Cleveland, O.—The Bd. of Education is stated to have awarded contracts as fololws for the Technical High School: Structural iron and steel work to the National Iron & Ware Co., 971 Hamilton St., for $42,996; excavation and masonry to D. C. Griese & Walker Co., 1417 Prospect St., S. E., for $51,866 and fieproofing to the National Concrete Co. at $27,000.

Cleveland, O.—It is stated that F. F. Barnam is preparing plans for a high school to be erected at E. 107th St., at a cost of $200,000.

It is stated that bids will be received until Sept. 3 by the Clk. Bd. Educ., for completing an annex to the Milford School. Chas. Orr, Dir. Schools.

Cincinnati, O.—It is reported that the Bd. Educ. rejected all bids for construction of Hughes High School, except that of the Gordon Engineering Co., for excavations at $20,720, and that of John Sperry & Son, 270 Calhoun St., for concrete foundations at $61,296. The estimate on the building have been raised from $510,000 to $650,000, and the Clerk directed to readvertise for bids.

**Columbus, O.*—H. P. Judd, Clk. Bd. Educ., writes that contracts for work on the Indianaola Ave. School (bids opened Aug. 5), have been awarded as follows: Brick work, Adam Schneider, 431 S. 4th St., $5,400; carpenter work, Aug. Roehr, Star Hotel, $3,330; cut stone work, Fish Stone Co., Columbus, $3,750, and excavation, John Braun, 564 E. Fulton St., $2,340.

*The contract for erecting the Women's dormitory for the Ohio State University is reported to have been awarded to E. K. Hibbs, of Columbus, for $57,000.

**Salem, Ore.*—The contract for constructing the Mechanic Arts School building in connection with the Corvallis Agricultural College, is reported to have been awarded to A. F. Peterson & Co., of Portland, for $37,363, and contract for heating the building to Gardner & Kendall, of Portland, at $3,525.

New Castle, Pa.—Helen L. Moseley, Clk. School Bd., writes that plans for the proposed new high school are to be submitted on Aug. 29.

**Kutztown, Pa.*—The contract to erect a gymnasium at the Keystone State Normal School at Kutztown, is reported to have been awarded to Robt. S. Rathburn, of Allegheny, for $40,000.

Bethlehem, Pa.—The Trus. of the Moravian College and Theological Seminary is reported to have awarded to Howard E. Stoudt the contract for the erection of the library building. The structure will be built of stone, 3 stories, 44x45 ft.

St. George, S. C.—Bids will be received until Sept. 3 by the Bldg. Com. (M. S. Connor, Clk.), St. George Special School Dist. No. 5, for erecting a brick school. C. Gadsen Sayre, archt., Anderson.

Flandreau, S. D.—Bids will be received until Sept. 4 by C. F. Larrabee, Acting Comr. Indian Affairs, Washington, D. C., for furnishing material and erecting a brick industrial building, with plumbing, steam heat and electric light at the Flandreau School. For further information apply to Chas. S. Peirce, Supt. School, Flandreau.

Nashville, Tenn.—The City Councils is stated to have passed a bill providing for the issuance of $300,000 High School bonds, the proceeds from the sale of which to be devoted to the purchase of a site and the erection and equipping of a High School.

Rutland, Vt.—The School Comrs. have asked for an appropriation of $20,000, to build an extension to the high school. Harvey R. Kingsley, Clk. School Board.

Penetanguishene, Ont.—Bids will be received until Aug. 20 by W. H. Hewson, Town Clk., for $23,000 High School bonds and $15,000 Public School bonds.

NEW INDUSTRIAL PLANTS.

See also "Business Buildings."

Middletown, Conn.—The Wilcox, Crittenden & Co., Mfgrs. of marine hardware, will, it is reported, rebuild plant recently burned.

Stamford, Conn.—The Engineering Specialty Co., of Meriden, is reported to be considering the erection of a 2-story factory, 40x150 ft., at Stamford.

** Items marked thus give the names of parties awarded contracts.*

New Castle, Del.—The Deemer Steel Casting Co. is reported formed, with a capital of $250,000, by Selden S. Deemer anad Edw. T. Price, for the construction here of a plant for the manufacture of steel castings. Plans are now being prepared.

Augusta, Ga.—W. J. Moore, Secy. Augusta Chamber of Commerce, is reported interested in the construction of an iron and steel plant at Augusta.

Montgomery, Ill.—The Lyon Metallic Co. is reported to have decided to erect an addition to its present plant at a cost of about $25,000.

**Evansville, Ind.*—Geo. George & Sons, 1308 Walnut St., it is reported, have secured the contract for the erection of a planing mill annex to cost about $20,000 for the Hercules Buggy plant. Harris & Shoppell, archts., 123 N. 4th St.

Bloomfield, Ind.—It is reported that the Bloomfield Vitrified Brick & Tile Co., will soon receive bids for the construction and equipment of a manufacturing plant. T. H. Schmutz, Chanute, Kan.; and C. C. Stein & Lloyd Begeman, of Westphalia, Ind., are directors.

Bonnieville, Ky.—Mrs. Marie Jamison will put in a paving and front brick plant for an extensive output, and desires complete mud and dry press equipment.

Baltimore, Md.—The Camden elevator of the Baltimore & Ohio R. R. (D. D. Carothers, Ch. Engr., Baltimore), at Henrietta and Howard Sts., is reported to have been destroyed by fire Aug. 8. It is said to be the intention of the railroad officials to seek a new site and erect a new building at once.

Newark, N. J.—It is stated that application for a permit to erect a $75,000 concrete power house has been made by the Celluloid Co., of Ferry St. The plans call for a one-story building of reinforced concrete, 99½x 220 ft., and 2 stacks each 175 ft. in height. The building will be erected at 83 to 99 Fillmore St., adjoining the company's works.

Rochester, N. Y.—The Bausch & Lomb Optical Co. has filed plans for an addition to the factory in St. Paul St., which will cost $150,000; it will be 236x124 ft. and 5 stories high. The company is also making preparations to add 2 stories to present factory.

Olean, N. Y.—The Chamber of Commerce is stated to have secured for Olean the Feder Silk Throwing Co., which will erect a 1-story 90x150 ft. mill to cost $20,000 and about $25,000 worth of machinery to be installed. Capacity 1,000 lbs. of silk a week.

Barberton, O.—The Diamond Match Co. is reported to be having plans prepared by Chas. Henry & Son, of Akron, for a 4-story addition, 125 ft. long, with a wing 60x100 ft., office building, to be erected at the plant here.

Shamokin, Pa.—John H. and Chas. K. Eagle, owners of the Eagle Silk Mills at Fairview, are reported to have purchased property on Rock and Race Sts. on which to erect a 3-story silk mill, bids for which will be asked as soon as the plans which are now being prepared by W. U. Jury, of Shamokin, are completed.

Memphis, Tenn.—The warehouse and grain elevator of Webb & Murray, recently burned, according to reports, will be rebuilt.

Tomahawk, Wis.—The Tomahawk plant of the United States Leather Co. is reported destroyed by fire on Aug. 2.

Milwaukee, Wis.—The file works of F. Westfahl & Co. at Cherry and 31st Sts., which were destroyed by fire Aug. 6, it is reported, will be rebuilt.

STREET CLEANING AND GARBAGE DISPOSAL.

Notes Arranged Alphabetically by States.

Baltimore, Md.—Bids will be received until Sept. 4 by the Bd. Awards (J. Barry Mahool, Pres.) for the removal and final disposition of garbage, dead animals and market refuse of this city from Jan. 1, 1908, until Jan. 1, 1918. J. L. Wickes, Comr. St. Cleaning.

Milwaukee, Wis.—The City Council on Aug. 5 passed a resolution providing for the appointment of Rudolph Hering, of New York, N. Y., to prepare plans and specifications for a garbage plant.

MISCELLANEOUS.

Notes Arranged Alphabetically by States.

Nome, Alaska.—Maj. W. M. Chittenden, Corps Engrs., U. S. A., Seattle, Wash., writes that the only bid received on July 29 for dredging and excavating in St. Michael Canal, Alaska, about 177,000 cu. yds., was submitted by the North American Dredging Co., of San Francisco, Cal., at $1.45 per cu. yd.

Bradley, Ark.—Bids will be received until Sept. 11 by W. H. Baker, Secy. Long Prairie Levee Bd. for the construction and raising of levee from Buncom Springs to Louisiana and Arkansas line, about 450,000 yds.

Little Rock, Ark.—Bids will be received at the office of Lund & Hill, Engrs. of Dist. No. 1, Pulaski County, at Little Rock, until Sept. 7 for the construction of 7 miles of open ditch, requiring about 143,000 cu. yds. earth excav., a reinforced concrete conduit, 84 in. diam., and 2,635 ft. long, as advertised in The Engineering Record; estimated cost, $76,500.

San Francisco, Cal.—Col. Wm. H. Heuer, Corps Engrs., U. S. A., retired, is reported to have completed plans for improvement of San Francisco water front and building of 180 wharves, which will give 60 miles of berth room for vessels engaged in the commerce of this port. Col. Heuer's work will be done under the direction of the Merchants' Committee.

Oakland, Cal.—Park bonds to the amount of $992,000 are reported sold.

Colorado Springs, Colo.—Local press reports state that new bids for the new drainage tunnel will be received by the Cripple Creek Drainage & Tunnel Co. Two sets of specifications will be prepared; one set will provide for completion of new drainage tunnel at its present dimensions, 7 x 10 ft.; the other set will provide for a smaller bore, 5 x 8 ft.

Stamford, Conn.—Bids will be received by Maj. Harry Taylor, Corps Engrs., U. S. A., New London, until Sept. 7 for dredging in Stamford Harbor, Conn., as advertised in The Engineering Record.

Wilmington, Del.—Bids will be received by Maj. C. A. F. Flagler, Corps Engrs., U. S. A., until Aug. 28 for jetty construction at new mouth Broadkill River, Del., as advertised in The Engineering Record.

Washington, D. C.—Bids will be received until Sept. 7 at the Bureau Yards and Docks, Navy Dept. (R. C. Hollyday, Ch. Washington, D. C.), for dredging and removing about 20,000 cu. yds. material from channel, Navy Yard, Washington, as per specification No. 1556. Est. cost, $38,000.

Washington, D. C.—See "Power Plants, Gas and Electricity."

Great Lakes, North Chicago, Ill.—Bids will be received at the Bureau of Navigation, Navy Dept., (W. H. Brownson, Chmn.) Washington, D. C., until Aug. 26 for furnishing material and grading at the naval training station, Great Lakes, North Chicago, Ill.

Joliet, Ill.—Bids will be received until Sept. 3 by the Bd. Comnrs., Spring Creek Drainage Dist., 221 Barber Bldg., (Geo. H. Monroe, Chmn.) for the excavation of channels, about 90,000 cu. yds. and constructing concrete walls, about 10,000 cu. yds. for said district.

**Sullivan, Ind.*—W. H. Jones, Jr., of Lebanon, Engr. and Supt. writes that Asbury H. Manuel, of Merom, Ind., has secured the contract for dredge work, tile drains, levees, etc., (bids opened Aug. 5) for $20,000.

Burlington, Ia.—Acting on report of engineers who have just finished survey of bottom lands north of Burlington in Des Moines County, the Bd. of Supervisors is reported to have on Aug. 6 decided to go ahead with the drainage project which affects 28,000 acres of lowlands. The cost of drainage will be $255,000.

Ft. St. Phillips, La.—Bids will be received until Aug. 30 by Capt. J. F. McIndoe, Corps Engrs., U. S. A., New Orleans, for constructing interlocking steel pile sea wall at Ft. St. Philip.

New Orleans, La.—Bids will be received by Capt. J. F. McIndoe, Corps Engrs., U. S. A., until Sept. 10 for dredging in Southwest Pass, Mississippi River, as advertised in The Engineering Record.

Bar Harbor, Me.—Bids will be received by Maj. Geo. E. Zinn, Corps Engrs., U. S. A., Potland, until Sept. 10 for construction of breakwater, near Bar Harbor, Me., as advertised in The Engineering Record.

Baltimore, Md.—Bids will be received until Aug. 21 by the Bd. Awards (J. Barry Mahool, Pres.), for borings on the sites of the new piers 4, 5 and 6. O. F. Lackey, Harbor Engr.

**Hadley, Mass.*—Danl. O'Connell & Sons, of Holyoke, are reported to have secured the contract for furnishing and placing 4,500 tons rip-rap bank of Connecticut River at Hadley at $1.60 per ton. Bids opened Aug. 9 by the Harbor & Land Comrs. at Boston.

Ipswich, Mass.—Bids will be received at the office of the Bd. of Harbor and Land Comrs, Room 131 State House, Boston, until Aug. 23, for dredging shoals in Ipswich River in the town of Ipswich, to consist of about 8,700 cu. yds.

Detroit, Mich.—Bids will be received until Aug. 26 by Col. Chas. E. L. B. Davis, Corps Engrs., U. S. A., Jones Bldg., for hire of dredging plant for use in Detroit River

Claksdale, Miss.—T. G. Dabney, Ch. Engr., Yazoo-Mississippi Delta Levee Dist., writes that levee contracts were awarded by this Levee Board on July 29 as follows: To W. A. Shippey, 298,000 cu. yds. (new work), 22 cts. per cu. yd.; Jack O'Grady & Co., 195,000 cu. yds. (new work), 25.9 cts.; Martin Jennings, 472,000 cu. yds. (of which 296,000 is new work), 19 to 23.3 cts.; J. H. Watkins & Co., 188,000 cu. yds., 19 to 23.3 cts.; W. L. Mosby, 97,000 cu. yds., 19.1 to 33.3 cts.; R. L. Cheshire, 77,500 cu. yds, 23 and 24 cts. The character of this work, where not designated, is enlargement of old levee.

**Two Harbors, Minn.*—The contract for the steel ore dock to be known as No. 6, has been awarded to Barnett & Record, of Duluth and Superior, Wis. It will be 1,008 ft. long and 73 ft. high. The deck on top will be 57 ft. wide and will accommodate 4 railroad tracks.

Ivanhoe, Minn.—Artbur E. Morgan, Engr. of St. Cloud, writes that contracts will be let on Aug. 20 for 5 ditches at Ivanhoe, some tile, but mostly dredge work; estimated cost, $24,275.

Elizabeth, N. J.—W. H. Luster, Jr., City Engr., writes that the lowest bid opened on Aug. 1 for constructing pier, crib and shed was submitted by Rhodes & Maumee, for $28,000

**Geneva, N. Y.*—The contract for erecting retaining wall along south bank of Castle Creek, west of Main St., is reported to have been awarded, on Aug. 10, to John Mennell at $8.10 per cu. yd.

Rye, N. Y.—Ralph L. Crow, 289 4th Ave., N. Y. City, wants bids to furnish fill, delivered either spread or alongside retaining wall at Pine Island, Milton Point, Rye. About 3,000 cu. yds. required.

Ft. Wood, N. Y. H., N. Y.—Bids will be received by G. C. Burnell, Constr. Q. M., U. S. A., until Aug. 30 for foundations, painting and erecting a 100-ft. iron flagstaff at this post, as advertised in The Engineering Record.

Brooklyn, N. Y.—The following are the bids opened on Aug. 7 by Bird S. Coler, Boro. Pres., for furnishing material and constructing a crib bulkhead on 8th Ward Market, bet. 36th and 38th Sts., 2d Ave. and New York Bay on the percentage bid system. Engineer's preliminary estimate of total cost, $156,934: Geo. B. Spearin, 90 West St., N. Y. City, 95.248 per cent.; B. Rolf, 39 Cortlandt St., N. Y. City, 98.4 per cent.; Phœnix Constr. Co., 41 Park Row, N. Y. City, 92.5 per cent.; W. H. Jenks, 59 Pearl St., N. Y. City, 111.3-5 per cent. and R. P. & J. H. Staats, 29 Bway., N. Y. City, 99 per cent.

New York, N. Y.—Bids will be received by Col. John G. D. Knight, Corps Engrs., U. S. A., Army Bldg., N. Y. City, until Sept. 2 for constructing and repairing dikes in Hudson River, as advertised in The Engineering Record.

Bids will be received until Aug. 27 by J. A. Bensel, Comr. Docks, for furnishing material and delivering about 3,000 cu. yds. sand and 7,500 cu. yds. broken stone.

Bids will be received by Henry S. Thompson, Acting Boro. Pres. and Comr. Pub. Wks., until Aug. 26, for the installation and construction of a suction or vacuum cleaning system in the Criminal Courts Bldg., Centre and White Sts., Boro. Manhattan.

The Otis Elevator Co., 17 Battery Pl., has secured contract for installing electric elevator in Stuyvesant High School, (bids opened Aug. 12) for $3,800.

The Bd. of Educ. on Aug. 12, awarded contract for erecting grandstands in athletic fields to Jas. MacArthur, at $23,800 for one in Queens Boro., and $33,700 for one in Richmond Boro.

Cleveland, O.—Bids will be received until Sept. 10 by Lieut.-Col. C. McD. Townsend, Corps Engrs., U. S. A., 813 Prospect Ave. S. E., for extension of breakwater at Cleveland Harbor.

Fairport, O.—Bids will be received until Sept. 10 by Lieut.-Col. C. McD. Townsend, Corps Engrs., U. S. A., 813 Prospect Ave., S. E., Cleveland, for extension of west breakwater at Fairport Harbor.

Cincinnati, O.—Bids will be received by Lieut.-Col. Wm. T. Rossell, Corps Engrs., U. S. A., Cincinnati, O., until Sept. 11 for constructing dams of concrete, etc., at head of Brown's Island, Ohio River, and for building dike and shoe protection in Ohio River, near head of Grand Chain, Ill., as advertised in The Engineering Record.

Panama.—Bids will be received until Aug. 26 by D. W. Ross, Genl. Purchasing Officer, Isthmian Canal Comn., Washington, D. C., for furnishing steel barges as per circular No. 383.

The following are the bids opened on Aug. 12 by the Isthmian Canal Com. at Washington, D. C., for 3 steel dump barges: (*a*) according to specifications, (*b*) on bidders plans: Newport News Shipbuilding & Dock Co., to deliver in New York, N. Y., (*a*) $66,000, 150 days; (b) $69,000, 175 days; Lewis Nixon, New York, N. Y., Colon delivery in 90 to 150 days, (*a*) $76,950; U. S. Steel Products Export Co., New York, N. Y. delivery (225 days) (*a*) $85,575; Maryland Steel Co., Baltimore, Md., deliver at Sparrow's Point, Md. (90 to 150 days), (a) $59,495; Merrill-Stevens Co., Jacksonville, Fla; deliver Jacksonville, (150 days) (*a*) $97,500; (*b*) $105,000; The Moran Co., Seattle, Wash.; deliver in 6 months, (*a*) $66,645; (*b*) $55,500.

Harrisburg, Pa.—The State Water Supply Comn. is reported to have had plans made for the construction of dikes at Matamoras, Pike Co., and in Falls Twp., Bucks Co., near Bristol, to keep the Delaware River from flooding the lands; the State appropriated $15,000 for this work.

Erie, Pa.—Clark Olds, Chmn. State Wharf Comn., writes that plans are not yet complete for the proposed wharf to be constructed here at a cost of $150,000.

**Philadelphia, Pa.*—The only bid received and opened by Maj. J. C. Sanford, Corps Engrs., U. S. A., for dredging in Delaware River at Perriwig Bar, was submitted by the American Dredging Co., of Philadelphia, Pa., at 33 cts. per cu. yd., scow meas., and the same was recommended for acceptance.

National Soldiers' Home, Va.—Bids will be received by B. A. Beeson, Treas. Southern Branch N. H. D. V. S., until Aug. 26 for filling behind Jones Creek revetment about 5,000 yds.

Tacoma, Wash.—Bids will be received until Sept. 2 by Maj. H. M. Chittenden, Corps Engrs., U. S. A., 602 Burke Bldg., Seattle, for dredging and bulkheading at Tacoma Harbor.

Seattle, Wash.—Bids will be received until Sept. 5 by Maj. H. M. Chittenden, Corps. Engrs., U. S. A., 602 Burke Bldg., Seattle, for dredging Swinomish Slough, Wash.

Two Rivers, Wis.—L. K. Pitz and Rudolph Groll, of Manitowoc, are reported to have secured the contract to erect a life-saving station for the government at Two Rivers for $15,400.

Morrell Station, P. E. I.—It is stated that bids will be received until Aug. 27 by Fred. Gelinas, Secy., Dept. Pub. Wks., Ottawa, Ont., for constructing an extension to the breakwater at St. Peter's Bay, Kings County, P. E. I. J. B. Hegan, Resident Engr., Charlottetown, P. E. I.

Mimico, Ont.—Bids will be received until Aug. 20, by H. G. McNaughton, Secy. Pub. Wks. Dept., Toronto, for constructing a concrete superstructure to the wharf at the Mimico Asylum.

THE NEW EMPIRE BRIDGE WORKS, ELMIRA, N. Y.

The Empire Bridge Co.'s extensive improvements to its plant at Elmira, N. Y., which have been under way since early in 1907, are progressing rapidly, and it is anticipated that the enlarged plant will be in full operation before the end of the year. All of the buildings are now well under way, most of the new machinery has been delivered and is being installed as fast as the progress of the buildings will admit.

This plant is located at Elmira Heights, and when completed will cover an area of about 15 acres. It is served by the Erie, Delaware, Lackawanna & Western and the Pennsylvania roads. The property was formerly known as the North Shop of the Elmira Bridge Co., by which it was built in 1895, and operated up to 1900, in connection with an older establishment of the same kind located in Elmira proper and known as the South Shop. The property passed into the hands of the American Bridge Co. on its organization in 1900, and was subsequently acquired by the present owners, who for several years have had in contemplation the improvements now under way.

Operations have heretofore been conducted in a single 90x400 ft. building, while the enlarged plant contemplates not only an extension to the original building, known as the Main Bridge Shop, making it 215x528 ft. in size, but the construction of a boiler and power house, machine shop, templet shop, and a forge shop. All buildings are of steel construction, column bearing, with brick curtain walls, concrete foundations, and slate or slag roofs.

The present plant and equipment gives employment to about 250 men and has an output of about 15,000 tons of steel bridge and building work per annum. When the enlarged establishment is in full operation more than double this number of men will be required, and with the installation of new machinery, which is all of the most modern type, together with additional handling facilities for heavy material, the output will be quadrupled, thus making one of the largest and best equipped producers of structural work in the East and in this respect placing it well towards the top of the list of structural shops of the world.

Direct current at 220 volts will be used throughout the plant for the operation of machinery and for lighting purposes, each machine being equipped with an independent motor. Enclosed arc lamps of the long flame type will be used for general lighting, with incandescent lamps for auxiliary and individual lighting, and the lighting equipment will be such as to admit of operation of the works with equal facility by night as by day.

About two miles of standard gauge railroad track is being laid for switching purposes, and switching service is performed by a 40-ton private locomotive. In addition there is also being built about two miles of narrow-gauge track throughout the plant for the conveyance of material on hand pushed buggies.

Two 100-ton track scales, one at the receiving end of the shop and the other at the finishing end, will record the weight of all car loads of raw material received and finished product shipped out.

The water supply comes from a system of wells which have already been sunk, and a purifying system has been installed to prepare the water for boiler purposes. A complete drainage and sewerage system has also been provided, together with thoroughly sanitary toilet equipment.

Fire protection is afforded by a complete and independent system of piping supplied by a pump of high capacity capable of maintaining six 1⅛-in. streams at a pressure of 125 lbs. The fire pump is automatic in its action and will be kept under steam and ready for immediate use at all times. A fire brigade will be organized among the workmen in the shop, who by frequent drilling are to be kept thoroughly proficient in the handling of the fire fighting equipment. An emergency hospital, in charge of a competent nurse, and equipped with all necessary surgical appliances, will be maintained on the premises for rendering first aid to injured employees.

The boiler house is 42x90 ft., in which the boiler plant consists of four 250 h.-p. water tube boilers, equipped with mechanical stokers, damper regulators and feed water regulators, and fed by two compound duplex pumps, each of which is of sufficient capacity to supply all boilers. The engine-room, which is 80x60 ft. in size, contains two 300-kw. generators, driven by horizontal tandem compound condensing engines, and one 100-kw. generator of the same type, driven by a vertical cross compound condensing engine, two air compressors of total capacity of 3,600 cu. ft. per minute, besides other minor engines. The entire width of the power house is spanned by a 20-ton electric crane for use in the installation of machinery and for subsequent handling of the machinery when necessary.

The machine shop building is 60x240 ft. Planers, slotters, boring mills, heavy lathes, and other machines for the execution of heavy work will be installed in the main aisle, which is 30 ft. wide, and served by a 15-ton crane running the entire length of the shop, while machine tools for lighter work will occupy the 15-ft. wings on either side, the entire area of which is covered by traveling jib cranes of special design.

A 60x240 forge shop will be devoted in part to the manufacture of bolts, nuts and rivets, and the remainder of the building to bending, forging, tempering and the making of loop rods and light eye-bars.

The 50x224-ft. templet shop will be fitted with saws, planers, boring machines and other wood working machinery needed for templet and pattern making purposes, and the basement of the same building will be used as a storage room for plant supplies and miscellaneous material.

The main bridge shop is 215x528 ft. In this building will be placed punches, chord boring machines, drill presses, shears, rotary planers, plate shears, reamers, hydraulic riveters and other machines necessary to the handling of main members of bridges and buildings of the heaviest type. There will be a system of 10 and 20-ton cranes overhead for general service and in addition all small machines will be served by special jib cranes for the handling of individual pieces. An extension, measuring 55x80 ft., at the west end of the main shop will provide space in which to take care of detail material.

The receiving yard, at one end of the main bridge shop for the storage and handling of raw material, and the shipping yard, at the other end of the same building, for loading and shipping the finished product, are each served by two electric traveling cranes on separate runways 600 ft. long. The combined storage area of these two yards is about 225,000 sq. ft., all of which is covered by skids to protect the material from rust by contact with the ground.

SEWAGE DISPOSAL AT PHILADELPHIA.

Director Stearns of the Department of Public Works of Philadelphia and Chief Geo. S. Webster of the Bureau of Surveys have recently visited Massachusetts cities possessing sewage-disposal works, as a preliminary measure to the organization of a division of the Bureau of Surveys, which shall have charge of the preparation of plans. An appropriation of $7,500 was made by Councils for the services of an expert in the preliminary work of this year. The general plan will be intrusted to a commission.

For the protection of the health of people of the State Dr. Samuel G. Dixon, State Commissioner of Health, obtained the passage of a bill in the last Legislature requiring all cities and towns in the State to make preparations for the scientific disposal of sewage. The time allowed was left to the discretion of the commissioner of health. In the case of Philadelphia it was agreed that five years would be plenty of time in which to make the plans and decide upon the system to be adopted.

This agreement was put in the form of an ordinance, carrying with it an appropriation for some preliminary work. While five years is allowed for the completion of the plan, the city must show to the State Commissioner each year that it is making progress. The bill was passed last spring, but the Department of Public Works has not taken up the work until now.

LARGE GAS ENGINES.

The accompanying illustration shows the type of gas engine now being built by Allis-Chalmers Co., Milwaukee, for the power house of the Indiana Steel Co.'s new works at Gary, Ind., and for other large installations.

These engines have the largest cylinder diameter of any gas engine yet built in this country, the sizes being 44 in. in diameter by 54 in. stroke. They have the same volumetric capacity as the engines built for the California Gas & Electric Co., which are 42 in. in diameter by 60 in. stroke. An engine of this size on blast-furnace gas of about 80 to 85 B. t. u. will give a safe maximum horse-power in the neighborhood of 4,000, but will work up to approximately 5,000 h.p. on the richer gases. The valve gear is located between the engines, concentrating the gear on a twin tandem in a way that makes it convenient for the operating engineer. This engine, as shown, is of the cut-off type, the quantity of gas and the time of admission both being under the control of the regulator. Allis-Chalmers Co. is building thirty-six units of the size mentioned. In one power house at Gary there will be seventeen units of that size, fifteen of which will be connected to 25-cycle alternators (rated at 2,000 kw., but which will, of course, have large overload capacity), and two will be direct-connected to direct-current generators, also of 2,000 kw. rated capacity. The power house is approximately 125 ft. wide and 1,000 ft. long. Another power house being built at Gary, of the same width and one-half this length, is also to be equipped with Allis-Chalmers units.

The weight of the engine is, in round numbers, 1,500,000 lb.; the crank pins are 20 in. in diameter; the shaft is 30 in. in diameter in the bearing; and the flywheel is 23 ft. in diameter, weighing 200,000 lb. The speed of this engine is 83⅓ r. p. m. The pistons and rods are water-cooled, water being introduced at the center and flowing forward to a discharge in the frame for the front piston and backward to a discharge in the tail guide for the rear piston, each piston having its separate supply. For dismantling or for cleaning, the rod is made in two parts joined at the central slide, the rear half going out at the rear of the engine and the other half going out through the frame, which is made open at the top for convenience.

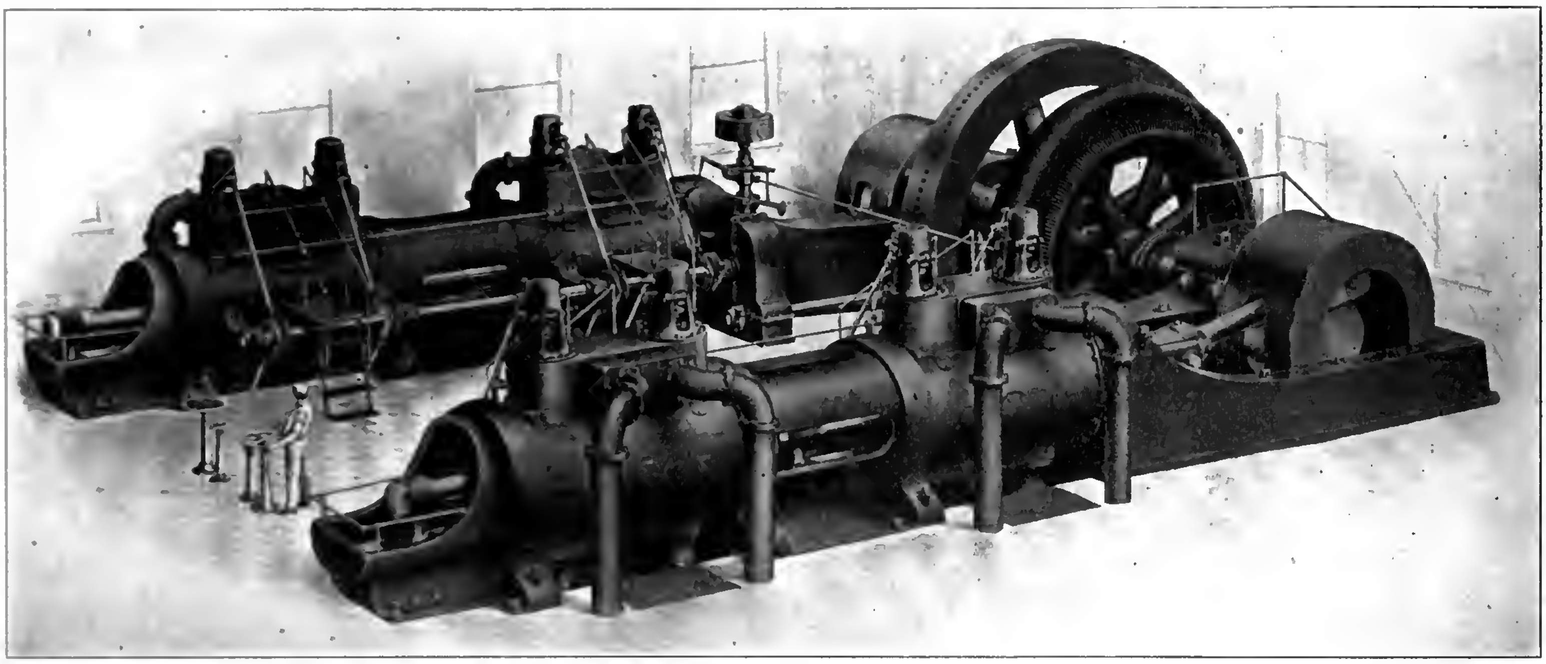
The frames for this engine weigh approximately 90 tons each, and one-half of each frame is buried in the foundation, in order to raise the floor line to a point

w[illegible]ke the slides on the valve gear readily accessible.

Within the past year Allis-Chalmers Co. has taken orders for thirty-six gas engines of 4,000 h.p. each, or an aggregate of 144,000 h.p., twenty-five of which are to be installed as a part of the mammoth new plant now in course of construction by the Steel Corporation at Gary, Indiana, seven for the Homestead plant of the Carnegie Steel Co., and four in the South Chicago works of the Illinois Steel Co. It will require 2,300 cars to transport these machines from the works of the Milwaukee Company to the different plants of the Steel Corporation, where they will be installed. The wide use of gas engines by the United States Steel Corporation marks an important step in the progress of steel manufacture in this country, as they are designed to operate upon the hitherto "waste" gas developed by the blast furnaces; thus inaugurating an important economy in steel production.

The majority of the Allis-Chalmers gas engines on order will drive electric generators of standard Allis-Chalmers type, 25-cycle, 3-phase. These machines are to be used for generating the necessary power to operate the heavy induction-motor driven rolls, the tilting and feed tables for the various passes, the hot saws, hot and cold pull ups, transfer tables, straightening machines, and cold saws, and other auxiliary machinery of the mills which are now ordinarily operated by means of steam power.

In addition to the gas-engine-driven electrical units, orders have also been placed with the Allis-Chalmers Co. for twelve gas-driven blowing engines. The Gary plant will have eight blowing engines, and the Homestead plant of the Carnegie Steel Co. has ordered the remaining four units. Each blowing engine has a capacity of 3,500 h.p., and will deliver 30,000 cu. ft. of free air per minute against a pressure of 18 lb. per sqare inch, which is ordinarily the maximum. All of the gas-driven blowing engines purchased by the steel company's plants will be equipped with "slick" type blowing tubs, the American patent rights covering which are owned by Allis-Chalmers Company.



FOUR-CYCLE DOUBLE ACTING TWIN TANDEM GAS ENGINE.

PERSONAL NOTES.

G. C. Hewitt, a consulting mining engineer, of Colorado Springs, Colo., died at his home in that city Aug. 12, aged [illegible] years.

Messrs. Elvin J. Becker, A. L. Northrop and Elmer C. [illegible] have been appointed assistant engineers on the New York State Engineer's staff.

Dr. Rudolph Hering, of the firm of Hering & Fuller, consulting engineers, New York City, has been retained by the city of Milwaukee to recommend a method of disposal for the garbage of that city.

Mr. C. G. Delo, engineer of maintenance of way of the Chicago & Alton R. R., at Kansas City, Mo., has been transferred to Bloomington, Ill., in the same capacity, succeeding Mr. W. B. [illegible], promoted.

Mr. John R. Freeman, of Providence, R. I., has been retained by the New York State Water Supply Commission to direct the investigation of the water power resources of the State ordered by the Fuller Act of this year.

Prof. L. G. Carpenter, of Fort Collins, Colo., has been retained by the provincial government of British Columbia to investigate various engineering problems, particularly those intended to furnish relief from difficulties due to existing water conditions.

Mr. W. A. Creek has been appointed county surveyor of Cedar County, Missouri, by Gov. Folk, succeeding Mr. F. M. Hackleman, resigned, and Mr. J. C. Smith has been appointed county surveyor of Crawford County, to fill the vacancy occasioned by the death of Bascom O. Butt.

Mr. David W. Ross, who has been succeeded as purchasing agent for the Panama Canal by Maj. Harry F. Hodges, Corps of Engineers, U. S. A., is to become the managing director of the Magnus Metal Co., of New York, and the Hewitt Mfg. Co., of Chicago, associated concerns.

Dr. Charles Stewart Wurts, for twelve years vice-president of the Cambria Iron & Steel Co., and a director for many years after he ceased to be vice-president, died Aug. 14, in Philadelphia. He was 78 years old and had not been actively engaged in business for several years.

Thomas Andrews, widely known for many years for his pioneer work in metallography, died some weeks ago at his home near Sheffield, England. He was a member of a family identified for many generations with the iron industry, and his well-known investigations were prompted by problems presented by the behavior of steel in service, particularly on railway rolling stock.

Mr. Wilbur J. Watson has resigned as bridge engineer of the Osborn Engineering Co., and has opened offices in the Citizens' Building, Cleveland, Ohio, as a specialist in the design, inspection and construction of bridges, buildings and special structures of steel and reinforced concrete. Mr. Watson has been associated with the Osborn Engineering Co. since 1898 and has had wide experience in the sort of work which he will make his specialty.

The United States Civil Service Commission will hold examinations in the large cities of the country on the dates indicated, of candidates for positions as follows: Nautical expert in the Hydrographic Office of the Navy Department, Sept. 18; computer, Naval Observatory, Washington, D. C., Sept. 11-12; mechanical draftsman in the office of the Chief of Ordnance, War Department, Sept. 18-19-20; chemist qualified as cement tester, for duty in the Reclamation Service, Sept. 18.

Maj. Lansing H. Beach, Corps of Engineers, U. S. A., on duty at the Infantry and Cavalry School and Staff College, Fort Leavenworth, Kan., as assistant commandant and instructor of engineering, has been ordered to Jacksonville, Fla., to relieve Maj. Francis R. Shunk, in charge of defensive works on the east coast of Florida and river and harbor work in that vicinity. Maj. Shunk has been ordered to St. Paul, Minn., to relieve Capt. Edward H. Schulz, in temporary charge of the improvement to the Mississippi River between St. Paul and Minneapolis, and in charge of improvements on the Missouri River.

Mr. A. W. Thompson, superintendent of the Wheeling division of the Baltimore & Ohio R. R., has been promoted to be chief engineer of maintenance of way with headquarters at Baltimore, succeeding Mr. J. B. Dickson, who has resigned to become assistant general manager of the Erie R. R. Mr. Thompson will be succeeded at Wheeling by Mr. O. Rickert, division engineer of the Monongahela division, who in turn will be succeeded by Mr. W. C. Barrett, now division engineer of the Wheeling division. Mr. F. J. Batchdler has been transferred from division engineer of the Shenandoah division to the same office on the Wheeling division, and has been succeeded in his former office by Mr. J. B. Myers, assistant engineer of the Cumberland division.

Mr. F. B. Maltby, who has been connected with the Panama Canal work as principal assistant engineer for the past two and one-half years, has resigned to become associated with Messrs. Dodge & Day, engineers and constructors, of Philadelphia, as chief engineer. Mr. Maltby is a graduate of the University of Illinois, with long experience in railroad construction, municipal engineering, and irrigation, and has been connected at various times with the Wisconsin Central, Missouri Pacific, Great Western and Illinois Central roads. He had charge, for the United States Government, of all the dredging operations in the lower Mississippi River and designed and built the lock and movable dam on the Osage River in Missouri. Mr. Maltby designed over $1,250,000 worth of dredging plant for the Panama Canal work and the preliminary plans and construction work for the Gatun lock and dam were under his direction.

BUSINESS NOTES.

The Stone & Webster Engineering Corporation, constructing engineers, Boston, have moved to their own building at 147 Milk St., corner of Batterymarch St.

Mr. C. J. Connell has been appointed assistant secretary in charge of the Accounting Department of the Universal Portland Cement Co., Chicago, and Mr. Frederick Blanchard has been appointed credit manager.

The general offices of the Pittsburgh Bridge & Iron Works, have been moved to the plant in Rochester, Pa.

On account of the increased business of the Dayton Pneumatic Tool Co., in the Buffalo district, an agency has been established with Root, Neal & Co., 178-180 Main St., Buffalo, N. Y. The latter concern will carry in stock a complete line of Dayton and Green pneumatic hammers as well as repair parts and accessories.

On account of the large sales of vises to the U. S. Government by the Pittsburgh Automatic Vise & Tool Co., Mr. H. M. Kearns has been appointed special Government representative by the company.

The Ambursen Hydraulic Construction Co., Boston, Mass., is building two dams, respectively 30x150 ft. and 27x250 ft., for the Grass River Paper Co., at Pyrites, N. Y.

Special catalogue No. 4 of the Tiffin Wagon Co., Tiffin, O., is devoted to illustrations and descriptions of the many different types of dumping and contractors' wagons made by the company. Specifications are given of bottom dump wagons with capacities from 1½ to 2½ cu. yd., four bucket steel dumping wagons, wooden contractors' carts, and two-wheeled steel-bucket carts for garbage removal and quarry use. The steel bucket wagons, designed for hauling stone, gravel, dirt and ashes, have four steel buckets with round bottoms pivoted about 3½ ft. above the ground, and are dumped by inverting the buckets. The two-wheeled round-bottom steel bucket carts, built in capacities from 1 to 1¾ cu. yd., have the bucket hung between the wheels, are very low and have no axle.

CONTRACTING NEWS

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS, ENGINEERS AND MANUFACTURERS

ENGINEERING AND BUILDING SUPPLIES

WATER.

Notes Arranged Alphabetically by States.

Beebe, Ark.—See "Power Plants, Gas and Electricity."

Monrovia, Cal.—The City Council is reported to have approved the plans of O. K. Parker, of Los Angeles, for pumping plant for water works.

Los Angeles, Cal.—Water Wks. Supt. Wm. Mulholland has presented to the Bd. of Water Comrs. a report recommending improvements to the water works to cost about $480,000, to include the enlargement of the Buena Vista pumping plant, to cost about $65,000; improving pumping station at Crystal Springs to cost $65,000, roofing of Ivanhoe and Bellevlue reservoir to cost about $17,000 and the purchase of 5,700 tons of pipe.

Fruita, Colo.—I. H. Whittemore, City Clk., writes that it is proposed to construct a reservoir here, at a cost of $25,000. Engineer, Fred Lowenhagen, of Fruita.

Tallahassee, Fla.—The citizens are reported to have voted on Aug. 13 in favor of municipal ownership of water works.

Millen, Ga.—See "Power Plants, Gas and Electricity."

Tifton, Ga.—The citizens are reported to have voted to issue $15,000 bonds to complete the water works and $15,000 for sewers.

Bloomington, Ill.—City Engr. Chas. F. Fautz is reported to have completed his report for 20-in. fire protection water main, which he estimates at $72,600.

Chicago, Ill.—Bids will be received until Aug. 27 by the Bd. Local Improv. (H. S. Dietrich, Pres.) for constructing water service pipes in Greenlake and Southport Aves.

Duquoin, Ill.—Press reports state that bids will be received on Aug. 26 for the construction of combined systeem of water works and sewers.

Lake Forest, Ill.—The City Council is reported to be considering the construction of municipal water works.

Weleetka, Ind. Ter.—See "Power Plants, Gas and Electricity."

Decorah, Ia.—It is reported that bids will be received until Sept. 10 (extension of date) by the Bd. of Superv. at Decorah, for constructing a water system at the poor farm at Freeport on either the automatic air pressure steel tank of 75 bbl. with 125 lb. pressure to the inch, 12-ft. steel wheel, steel tower 70 ft. high and pump to complete the job, or 500-bbl. tank overhead system, 60 ft. high. I. Linnevold, Co. Aud.

Arcadia, La.—The Town Council is reported to have selected an engineer to prepare plans and specifications for water works. When completed the question of constructing same will be voted upon.

**Pittsfield, Mass.*—This city through its Bd. of Water Comrs. has contracted with the Ambursen Hydraulic Construction Co. of Boston, for a reservoir dam on Ashley Brook to create additional water supply. The dam is on a gravel foundation, the general dimensions being 32 ft. in height by 465 ft. long. The designs are prepared by the contracting company and the work will be executed under the general supervision of Arthur B. Farnham, City Engr.

**Lowell, Mass.*—The Holly Pump Co. is reported to have secured the contract on Aug. 12 for installing a pump for $26,900.

Escanaba Mich.—The Escanaba Water Co. (Geo. L. Weaver, Pres.) is reported to be preparing to construct a filter plant.

Grosse Pointe Farms, Mich.—Bids will be received until Aug. 31 at the office of J. G. Armstrong, Village Clk., for furnishing and laying about 2¾ miles 6, 8 and 10-in. c. i. water pipes, together with 33 fire hydrants, and all valves, specials and details complete.

Lawton, Mich.—The National Constr. Co., of South Bend, Ind., will have charge of the construction of water works for Lawton, to cost about $11,000.

Stambaugh, Mich.—Bids will be received until Sept. 9 by the Village Council for improving the water works, as advertised in The Engineering Record.

Grand Rapids, Mich.—Consulting Engr. Alvord, of Chicago, Ill., has presented to the Lake Michigan Water Comn. a preliminary report on the installation of the Lake Michigan water plant, with a daily capacity of 25,000,000 gal., which he estimates will cost $2,470,000. L. W. Anderson is City Engr.

Cokato, Minn.—The citizens are reported to have voted to construct water works.

**Belle Plaine, Minn.*—W. D. Lovell, of Minneapolis, has secured the contract for constructing water works, including steel tower and tank (bids opened Aug. 12), for $8,786. Engineer, Oscar Claussen, of St. Paul.

Seminary, Miss.—The Town Council is reported to have decided to sink an artesian well, and also install a system of water works.

Sanders, Mont.—Bids will be received until Aug. 31 by the Sanders Co-operative Ditch Co. (Dr. J. R. Thompson, Secy.) for constructing an irrigation ditch, to consist of the excavation and placing an embankment of about 175,000 cu. yds. material. Henry Gerharz, Engr., Billings.

**Winside, Neb.*—Walter Gaebler, Village Clk., writes that the contract for constructing water works (bids opened Aug. 16) has been awarded to Sioux City Fdry. & Machine Co., of Sioux City, Ia., for $10,000.

Norfolk, Neb.—Bids will be received until Aug. 30 by Julius Hulff, City Clk., for furnishing material and constructing a water main on a portion of 7th St.

Kearney, Neb.—Geo. E. Ford, City Clk., writes that an ordinance has passed first reading in Council providing for the construction of water works to cost about $100,000.

Wood River, Neb.—See "Power Plants, Gas and Electricity."

**Grand Island, Neb.*—H. E. Clifford, City Clk., writes that the contract for constructing 7 blocks 6-in. c. i. pipe water mains (bids opened July 7) has been awarded to E. C. McCashland, of Grand Island, for $3,225.

Belvidere, N. J.—The City Council is reported to have granted the Buckhorn Springs Water Co., a franchise to furnish Belvidere with water to be brought from Scott Mountain, 1½ miles from city. Jos. M. Rosenberry and Silas Gibbs are reported to be among the incorporators.

Orange, N. J.—Press reports tstate that bids will be received on Sept. 9 for the construction of reinforced reservoir, gate-house, etc., at West Orange.

Paulsboro, N. J.—Bids will be received until Aug. 29 by Chas. M. Gwilliam, Boro. Clk., for $46,000 water bonds.

Brooklyn, N. Y.—Bids will be received by John H. O'Brien, Comr. Water Supply, Gas and Electricity, New York City, until Aug. 28, for furnishing, delivering and laying water mains and removing existing water mains in Bedford, Clinton, Greenpoint, Harrison, Johnson, Manhattan, Meserole and Nassau Aves.; Humboldt, Keap, Lorimer, Meserole, Oakland, Provost, Scholes, Waterbury and White Sts., and in Delmonico Pl., Boro. Brooklyn.

New York, N. Y.—Bids will be received by the Park Bd. (Moses Herrman, Pres.) until Aug. 29, for furnishing, delivering and laying c. i. water pipe and appurtenances in the Harlem River driveway, bet. 155th and 177th Sts.

Rome, N. Y.—The State Water Supply Comn. is reported to have granted permission to the city of Rome to procure a new system of water from Fish Creek for a gravity system.

Spencerport, N. Y.—Dr. H. M. Roberts, P. F. Coleman and W. H. Link, of Herkimer, are reported to have petitioned the Village Trus. for a franchise for water works and sewers.

Rocky Mount, N. C.—See "Power Plants, Gas and Electricity."

Grand Forks, N. D.—Bids will be received until Aug. 30 by W. V. O'Connor, City Aud., for constructing a water main in 8th St and Ione Ave.

Columbus, O.—Bids will be received until Aug. 30 by the Bd. Pub. Service (E. F. McGuire, Secy.) for laying c. i. force mains in Dublin Pike, Dublin Ave. and Spring St., Franklin Township and in the city of Columbus; as per contract No. 17, requiring about 2,420 tons c. i. pipe, 11,000 lbs. iron castings, 26 gate valves, varying in size from 3-in. to 36-in. 130 tons bell and spigot special castings, 4 tons flange special castings, 7,500 lbs. twisted steel rods, 2,200 cu. yds. macadam, 2,500 lbs. manhole steps and tie rods, etc. Henry Maetzel Ch. Engr., Bd. Pub. Service.

Hamilton, O.—Bids were opened on Aug. 13 by the Bd. of Pub. Service as follows: (Engineers John W. Hill & Sons, First Natl. Bank Bldg. Cincinnati): The Press ler Prospecting & Eng. Co., Cincinnati, 20 sand pumping wells, ea., $35; driving 8-in. wells, $4.50 per ft; 1,343.3 cu. yds. trench excav., $1.10 and 106.5 tons pipe-laying, 24-in., $10. Dravo-Doyle & Co., Pittsburg. Pa., 2 centrifugal pumps, ea., $3,750; 2 A. C. motors, ea., $2,800 and one 1,000-ft. pole line, $1,250. D. R. P. Dimmick, Cincinnati, 6,000 lbs. specials, 4½ cts.; 98 tons 24-in. c. i. pipe, $33.50 and 11,000 lbs. H. & S. specials, 3½ cts.; 1,343.3 cu. yds. trench excav., 80 cts. and 106.5 tons pipe-laying 24-in., $12. W. H. Louthan, Hamilton, 670 cu. yds. excav. pump pit, $2.50; 220.3 cu. yds. concrete pump pit, $11; 126.6 cu. yds. puddle pump pit, $2; 1 superstructure pump pit, $1,0-0; 13,000 lbs., structural steel pump pit, 3¾ cts.; 1 steel door pump pit, $40; 2 4 m. g. d. centrifugal pumps, $2,000; 2 100-h.-p. A. C. motors, $2,695, and 1 1,000-ft. pole line, $1,050.

Elmore, O.—E. Jaiger, City Clk., writes that it is proposed to construct water works at a cost of $25,000. Engineer, Geo. Harrop, of South Bend, Ind.

New Carlisle, O.—The question of constructing water works is reported under consideration here.

Oklahoma City, Okla.—Bids will be received by W. C. Burke, City Engr., until Aug. 31 for installing a water softening plant of 50,000 gal. daily capacity at the city water works pumping station, as advertised in The Engineering Record.

Enid, Okla.—An election will soon be held to vote on issuing $285,000 bonds for sewers, $10,000 for septic tanks and $15,000 for water works extension.

Shawnee, Okla.—The City Council is reported to have decided to improve the water system.

Corvallis, Ore.—See "Power Plants, Gas and Electricity"

**Steelton, Pa.*—The following are reported to be the totals of bids opened on Aug. 6 by Boro. Council for the construction of a filter plant: Lea Constr. Co., of New York, N. Y., $80,482; Coder & Miller, of Harrisburg, $89,583; Bunting Constr. Co., of Flushing, N. Y., $71,553 (awarded contract).

Pawtucket, R. I.—The following are reported to be the bids opened on Aug. 15 for the construction of new pumping station; Wilmarth & McKillop, $42,120; F. G. Rowley Co., $45,000; Cruise & Simley, $46,391; Robt. Wilson, $49,950, and H. F. Ross Co., $64,300.

McEwen, Tenn.—Plans are reported to have been completed for water works.

Marian, Tex.—The City Council is reported to be considering the question of establishing water works.

Berclair, Tex.—C. B. Lucas is reported interested in the construction of water works.

Temple, Tex.—The Citizens Com. is stated to have recommended to City Council that an election be held to vote on issuing $150,000 bonds for the construction of water works.

Prosser, Wash.—The City Council is reported to have appropriated $10,000 for a deep well.

Winnipeg, Man.—See "Public Buildings."

SEWERAGE AND SEWAGE DISPOSAL.

Notes Arranged Alphabetically by States.

**Douglas, Ariz.*—The City Clerk writes that the McQuatters Plumbing & Machinery Co. is now completing the sewerage system, which will cost about $75,000. Engineer. F. H. Olmstead, of Los Angeles, Cal.

**Arkadelphia, Ark.*—Robinson Bros., of Pine Bluff, are reported to have secured the contract for the construction of the 45,280 ft. of clay pipe sewers opened by the Comrs. of Sewer District No. 1 on Aug. 15 for $28,362.

**Camden, Ark.*—B. C. Pouncey, of Helena, is reported to have secured the contract for constructing 10,000 ft. of sewers in Dist. 2 (bids opned Aug. 15), for $6,200.

Lodi, Cal.—It is reported that plans and estimates are being prepared for a sewerage system.

Colusa, Cal.—The Town Trus. are reported to be considering the question of constructing a sewerage system.

**Denver, Colo.*—Moses Hallett, Trus. of the Estate of Geo. W. Clayton, Room 31, Clayton Blk., Denver, writes that the contract for furnishing material and constructing the Clayton College pipe line comprising about 4 miles of vitr. clay pipe and steel pipe with manholes and other appurtenances according to plans of Peter O'Brien, Nassau Blk., Denver, has been awarded to the Gaffy & Keefe Constr. Co., of Denver, for $52,000.

Golden, Colo.—The Council is reported to have passed an ordinance creating sanitary sewer Dist. No. 1, comprising all the city south of Clear Creek; probable cost of proposed sewers, $25,000.

**Gainesville, Fla.*—This city on Aug. 10 awarded contract for 6 miles of 4-in. house branches to F. H. Beemann, of Gainesville, at about $19,000.

Tifton, Ga.—See "Water."

Duquain, Ill.—See "Water."

Springfield, Ill.—Bids will probably be called for in about 60 days for a sewer to drain southeastern part of city, to be 5,000 ft. long, of which 2,500 ft. will be 6-ft. brick and 2,500 ft. of 4-ft. brick; estimated cost, $35,000.

Carlinville, Ill.—The Council is reported to have adopted an ordinance providing for the construction of sewers.

**South Bend, Ind.*—Staples & Ackerman, of South Bend, are reported to have secured the contract for constructing the Emerson St. pipe sewer for $4,500.

Indianapolis, Ind.—Bids will be received until Aug. 28 by the Bd. Pub. Wks. (Jos. T. Elliott, Pres.) for constructing a pipe sewer, varying in size from 15 to 18-in. in a portion of Central Ave.

Peru, Ind.—It is stated that bids will be received until Aug. 27 by the Common Council for constructing 4,000 ft. of 10-in. vitrified tile sewer. Wm. O'Hara, City Clk.

Columbus, Ind.—It is stated that bids will be received until Sept. 3 by Lawrence F. Orr, City Clk., for 9,838 ft. of main and lateral sewers. W. H. Rights, City Engr.

Independence, Kan.—J. D. Kramer, City Clk., writes that the question of constructing sewers on the west side of city is being considered, but nothing definite yet done. W. F. Keller, Ciy Engr.

**Westfield, Mass.*—Oren E. Parks, Town Engr., writes that the contract for constructing sewers (bids opened Aug. 3) has been awarded to Daniel A. Dorey, of Natick, for $3,300.

Gardner, Mass.—The citizens are reported to have voted Aug. 7 to appropriate $15,000 for the construction and extension of the sewerage system and sewage disposal plant.

Springfield, Mass.—The Com. on Sewers and Drains is reported to have decided to recommend the construction of sewers in Carew and Armory Sts., to cost about $20,000 and on Long Hill St., at a cost of $6,700.

**Howell, Mich.*—The Trustees of the State Sanitarium for Tuberculosis at Howell, will build a sewage dsiposal plant. Contractor Chas. G. Jewett, of Howell, Consulting Engineer; Burton J. Ashley, 6515 Normal Ave., Chicago, Ill.

Iron River, Mich.—All bids opened on Aug. 7 by Village Council for the construction of sewers in Main Dist. No. 1 are reported to have been rejected, being too high, and it is said that new bids will not be called for again until the spring. Chas. A. Otto, Village Clk., Engineer, E. G. Bradbury and G. P. Shute, 85 No. High St., Columbus, O.

**Morris, Minn.*—Tanner Bros., of Minneapolis, are reported to have secured the contract for additional sewers in Morris for $7,000.

Bozeman, Mont.—Harry A. Bolinger, City Clk., writes that bids will be received on Sept 5 for the construction of pipe sewers, to cost about $36,000. C. M. Thorpe, City Engr.

Billings, Mont.—Plans are being prepared for a main sewer to consist of 12, 15, 18 and 21-in. pipe, and 3,500 lin. ft. concrete culvert 8 ft. wide and 5 ft. high; estimated cost, $87,000. Henry Gerharz, City Engr.

Butte, Mont.—About $15,000 will be expended for concrete sewers, plain or reinforced. Alex. Leggat, City Engr. M. A. Berger, City Clk.

Joplin, Mo.—Plans are reported to be on file at the office of the City Engr., for new storm sewer, which will cost about $606,213, and take about 10 years to construct. The work is divided into 7 districts, namely 1 to 7. The work will all be let by contract. The cost of the different divisions of the sewers, according to the estimates of the engineers, will be: Joplin main, $120,796; Joplin St. main, $24,679; Kentucky Ave. mains,

* *Items marked thus give the names of parties awarded contracts.*

$14,105, [illegible] St. mains, $16,431; Willow Branch main, $18,[illegible]; Central main, $160,271; northwest mains, $28,-860, W. Joplin mains, $40,130; Smelter Hill mains, $13,150; Division St. mains, $21,948, and Broadway mains, $18,780.

N. B. Spillman, City Engr., writes that an election will be held in the near future to vote on issuing $600,000 bonds for the construction of new storm sewers.

Asbury Park, N. J.—John L. Coffin, Supt. Water & Sewers, writes that the following are the bids opened on Aug. 17 for furnishing material and laying about 1,200 ft. 12-in. wrought-iron sewer outlet pipe, extending seaward from tidemark: Chas. Ippolito, Orange, $12,000; J. Thompson & Co., Avon, $10,500; Watson Machine Co., Paterson, $7,200; Merritt & Chapman Co., New York, N. Y., $5,738; McCay Eng'g Co., Baltimore, Md., $5,375; and A. B. Marsden & Co., Utica, N. Y., $4,900.

**Pekin, Ill.*—John R. Siebert, City Engr., writes that the following are the bids opened on Aug. 12 by the Bd. of Local Improvements for constructing sewers: (*a*) E. R. Harding, Racine, Wis. (awarded contract); (*b*) Independent Constr. Co., Davenport, Ia.; (*c*) Peoples Constr. Co., Davenport, Ia.; (*d*) Chas. W. O'Neil, Peoria. (Informal, rejected).

Aurora, Neb.—A. O. Hartquest, City Engr., writes that bids are to be received at once for the proposed sewerage system to cost about $10,500. Dennis Saylor, City Clk.

Norfolk, Neb.—Separate bids will be received until Aug. 30 by Julius Hulff, City Clk., for furnishing material and constructing Dist. Sewer No. 1; main sewer on a portion of 1st St., taking up and replacing the main sewer pipes at the mouth of the main sewer where same enters into the Elkhorn River.

Fairview, N. J.—The citizens are reported to have voted to construct a sewerage system; the estimated cost of main trunk and main lateral will be about $195,000.

**Plainfield, N. J.*—Andrew J. Gavett, City Surveyor, writes that T. Foster Callahan, of Elizabeth, has secured the contract for constructing sanitary sewers (bids opened Aug. 5) at the following bid: 1,151 lin. ft. 8-in. sewer, under 6 ft. deep, 48 cts.; 11,860 lin. ft. 8-in. sewer, 6 to 8 ft. deep, 55 cts.; 5,753 lin. ft. 8-in. sewer, 8 to 10 ft. deep, 64 cts.; 1,463 lin. ft. 8-in. sewer, 10 to 12 ft. deep, 70 cts.; 430 lin. ft. 10-in. sewer, under 6 ft. deep, 57.5 cts.; 555 lin. ft. 10-in. sewer, 6 to 8 ft. deep, 64 cts.; 743 lin. ft. 10-in. sewer, 8 to 10 ft. deep, 75 cts.; 370 lin. ft. 10-in. sewer, 10 to 12 ft. deep, 83 cts.; 50 lin. ft. 10-in. sewer, 12 to 13 ft. deep, 85 cts.; 1,617 lin. ft. 8-in. cast iron sewer, under 6 ft. deep, $1.25; 608 lin. ft. 8-in. c. i. sewer, 6 to 8 ft. deep, $1.45; 72 lin. ft. 10-in. c. i. sewer, under 6 ft. deep, $1.90; 200 lin. ft. 10-in. c. i. sewer, 6 to 8 ft. deep, $2.10; 273 10-in. c. i. sewer, 8 to 10 ft. deep, $2.30 450 lin. ft. 10-in. c. i. sewer, 10 to 12 ft. deep, $2.50; 34 manholes, under 8 ft. deep, ea., $44.50; 14 manholes, 8 to 10 ft. deep, ea., $47.50; 6 manholes, 10 to 14 ft. deep, ea., $52.50; 687 branches on 8-in. sewer, ea., 55 cts.; 60 branches on 10-in. sewer, ea., 90 cts.; 30 crosses on 8-in. c. i. sewer, ea., $6.50; 4 tees on 8-in. c. i. sewer, ea., $3; 1 cross on 10-in. c. i. sewer, $9; 3 tees on 10-in. c. i. sewer, ea., $4; 19 flush tanks, ea., $75; 2,795 lin. ft. 4-in. vitr. pipe house connections, 30 cts.; 150 lin. ft. 4-in. c. i. house connections, 95 cts.; total, $24,089. Totals of other bids: John Callery, Weehawken, $26,058; C. M. Meeker, Plainfield, $25,083; E. W. Chamberlain, Westfield, $32,614; Cavalluzzo & Zizzo, Newark, $40,454; Jas. J. Fusco, Montclair, $35,583; MacNenamin & Hillpot, Bound Brook, $20,520; Warren B. Travell, Plainfield, $27,630; T. J. McGovern, Trenton, $37,704; Eveline Bros., New Britain, Conn., $30,272.

Andrew J. Gavett, City Surveyor, writes that the lowest bid opened on Aug. 5 for constructing storm sewers was submitted by C. M. Meeker, of Plainfield, at the following bid: [illegible] 343 lin. ft. [illegible] sewer, $2.80; 5 manholes, ea., $45; [illegible] ea., $3; total, $7,405. Totals of other bids: Eveline Bros., New Britain, Conn., $17,176; T. J. McGovern, Trenton, $[illegible]18; Warren B. Travell, Plainfield, $8,[illegible]; [illegible] Smith, Plainfield, $7,834; and MacNenamin & Hillpot, Bound Brook, $10,-351.

Cape May, N. J.—The [illegible] Council is reported to have instructed City [illegible] Townsend to prepare plans for improved [illegible] drainage.

Riverside, N. J.—The date of opening of bids for the construction of a sewerage system to consist of 10 miles of sewers 8 to 24-in. diam., pump house, engines, pumps, pump well and disposal works, has been extended from Aug. 19 to Sept. 2, as advertised in The Engineering Record. Engineer, Wm. H. Boardman, 427 Walnut St., Philadelphia, Pa. Irven Kollo, Township Clk.

South River, N. J.—Chas. Anderson, City Clk., writes that it is proposed to construct a sewerage system, to cost about $30,000. Engineer, Josiah Tice, of New Brunswick.

Long Island City, L. I., N. Y.—Bids will be received until Aug. 29 by Jos. Bermel, Boro. Pres., for constructing sewers and appurtenances in portions of 10th, 19th and 17th Sts., Wilbur, 12th, Metropolitan and 7th Aves. Engineer's estimate: 12,015 lin. ft. 6, 12, 15 and 18-in. vitr. salt-glazed or cement concrete pipe sewer; 573 lin. ft. salt-glazed or cement concrete culvert pipe sewer; 52 manholes; 140 M ft. timber for bracing and sheet piling; 28,500 ft. timber for foundation, etc.

Syracuse, N. Y.—Bids will be received until Aug. 27 by R. J. Shanahan, Compt., for $50,000 intercepting sewer bonds.

Kingston, N. Y.—Bids will be received by the Bd. Water Supply at the office of Thos. Hassett, Secy., No. 299 Broadway, New York, N. Y., until Sept. 3, for constructing a portion of an intercepting sewer in the City of Kingston, Ulster County, N. Y. Engineer's estimate: 5,500 cu. yds. earth excav.; 350 cu. yds. rock excav.; 4,813 lin. ft. 24-in. vitr. sewer pipe, 77 lin. ft. 24-in. c. i. pipe; 19 manholes, cutting through bulkhead at outfall, cleaning up.

Spencerport, N. Y.—See "Water."

Grand Rapids, N. D.—It is stated that bids are asked by City Council until Sept. 2 for constructing a lateral sewer. W. V. O'Connor, City Aud.

**Columbus, O.*—The contract for the construction of the sewage force main is reported to have been awarded on Aug. 15 to the York Constr. Co., at $39,915.

Oakley, O.—It is stated that bids will be received until Aug. 27 by David K. Mason, Village Clk., for constructing sewers in Dist. No. 2.

Norwood, O.—It is stated that bids will be received until Aug. 31 by the Bd. Pub. Service (L. H. Genhart, Clk.), for constructing storm water sewers in a portion of the ravine east of Montgomery Pike.

Asbury Park, N. J.—John L. Coffin, Supt. Dept. Water & Sewers, writes that the following are the bids opened on Aug. 7 for the construction of about 10 miles of pipe sewers: (*a*) A. E. Marsden & Co., Utica, N. Y.; (*b*) Bartholomew & Smith, Asbury Park; (*c*) Chas. Ippolito, Orange; (*d*) Jas. C. Fusco, Montclair; (*e*) Charlton & Weston, Yonkers, N. Y.; (*f*) N. J. Contr. & Eng. Co., Newark; (*g*) Hardman & Deidrichson, Perth Amboy.

**Youngstown, O.*—Anthony O'Horo is reported to have secured the contract for constructing the Elm St. sewer for $5,551.

Stillwater, Okla.—The City Council is reported to be considering the construction of a sewerage system.

Enid, Okla.—See "Water."

Wilkesbarre, Pa.—B. K. Finch, Engr. of Sewers, writes that bids have not yet been asked for the construction of the sewer in Union St. from No. Pennsylvania Ave. to river; it will be of brick and cost about $100,000. Fred H. Gates, City Clk.

McAdoo, Pa.—The Boro. Council is reported to be considering the question of constructing a sewerage system.

Reading, Pa.—The City Council on Aug. 12 passed ordinances as follows: Providing for the construction of house sewers in Dist. 13, and make provision for improvement bonds to the amount of $80,000, instead of $60,000; providing for the construction of house sewers in Dist. 11, at cost of $190,000, instead of $160,000; and to amend ordinances for the construction of house sewers in Dist. 4, at cost of $155,000, instead of $130,-000; Dist. 6, at a cost of $190,000, instead of $160,000; Dist. 5, at a cost of $190,000, instead of $170,000.

Allegheny, Pa.—The Finance Com. of Council has reported favorably the ordinance providing for the construction of a sewage plant at Allegheny City Home at Claremont, to cost about $10,000.

**York, Pa.*—John A. Raeyling is reported to have secured the contract for construction of storm sewer on W. Jackson St. from Tylers Run easterly, at $4.25 per lin. ft.

Sumter, S. C.—Bids will be received until Sept. 5 by the Sewerage Comrs. (C. M. Hurst, Secy.) for constructing a sanitary sewerage system, to consist of about 14 miles pipe, 18 to 22-in.; manholes, flush tanks, etc. Wm. H. Lyon, Consulting Engr., Sumter.

Webster, S. D.—Bids will be received until Sept. 3 (readvertisement) by the City Council for constructing a system of sewerage. Bids will be received on both glazed sewer pipe and concrete sewer pipe, all sizes over and including 18-in., and on glazed sewer pipe, all sizes under 18-in. Carl Malmberg, City Aud.

Johnson City, Tenn.—See "Paving and Roadmaking."

Chattanooga, Tenn.—Local press reports state that bids will be received until Sept. 16 for the construction of Chestnut St. sewer to extend from 9th St. to the river.

Olympia, Wash.—See "Paving and Roadmaking."

Morgontown, W. Va.—Fred C. Flenniken, City Recorder, writes with regard to proposed paving and sewers, that the work will not be let by contract, but will probably be done by city force account.

Lake Mills, Wis.—Bids will be secured by N. H. Falk, City Clk., until Sept. 13 for the construction of about 9,777 ft. 6 to 24-in. vitr. pipe sewers, 26 manholes and 10 catch-basins. Engineer, W. G. Kirchoffer, 31 Vroman Bldg., Madison.

Beloit, Wis.—It is stated that bids will be received until Sept. 4 by the Bd. Pub. Wks. for constructing sanitary sewers in sundry streets.

BRIDGES.

Notes Arranged Alphabetically by States.

**Winters, Cal.*—The Bd. Supervisors of Yolo County are reported to have awarded the contract for constructing the concrete bridge over Putat Creek at Winters to W. M. Concannon, 490 Orchard St., for $46,903.

Adin, Cal.—It is stated that bids will be received by the Bd. of Superv. (L. S. Smith, Clk., Alturas), until Sept. 16, for constructing bridge across Ash Creek, at Main St., Adin.

Santa Barbara, Cal.—It is stated that bids will be received by C. A. Hunt, Co. Clk., at Santa Barbara, until Sept. 3, for constructing bridge across San Jose Creek at Hollister Ave., Third Road Dist.; constructing bridge across Santa Inez River, Fourth Road Dist., and repairing bridge across Santa Maria River, Fifth Dist.

Yosemite, Cal.—Bids will be received until Sept. 10 by Maj. H. C. Benson, 14th Cavalry, Acting Supt., Yosemite National Park, Yosemite, for constructing a Class C steel bridge across Merced River in Yosemite Valley to replace present wooden bridge. Piers of present bridge to be strengthened and old bridge to be used for false work.

**Sacramento, Cal.*—The Bd. of Superv. is stated to have awarded the contract (bids opened July 25), for constructing the Fair Oaks Bridge over the American River near Fairoaks to the Western Bridge Co., for $63,000.

Farmington, Cal.—Bids will be received by Eugene D. Graham, Clk. Bd. Superv., at Stockton, until Sept. 3, for the construction of a two-span steel bridge over Oregon slough, near the R. R. station, Farmington.

**Los Angeles, Cal.*—A contract is stated to have been been awarded by the Salt Lake Ry. Co. to the Atlantic, Gulf & Pacific Constr. Co., 220 Market St., San Francisco, for the substructure of the new bridge which is to span the San Gabriel River at West Long Beach. It will be a single rolling lift bridge, with a span of 180 ft., and will rest upon three concrete piers.

Sedalia, Colo.—It is stated that bids will be received until Sept. 3 by T. W. Jaycox, State Engr., Denver, for constructing a 100 ft. reinforced concrete bridge across Plum Creek at Sedalia.

Sandpoint, Idaho.—It is stated bids will be received by the Co. Comrs. (Ignatz Weil, Clk.), at Rathdrum, until Sept. 2, for constructing bridge across Pack River at Sandpoint.

**Chicago, Ill.*—John J. Hanberg, Comr. Pub. Wks., is reported to have opened bids Aug. 17 and awarded contracts for constructing bridge over a branch of Chicago River, as follows: Superstructure, to King Bridge Co., of Cleveland, O., for $29,500; and substructure to Fitzsimons & Connell Co., for $50,000.

Rock Island, Ill.—The Council is stated to have approved plans prepared by City Engineer Treichler for the construction of a 117-ft. bridge over the canal, at an estimated cost of $8,000.

Danville, Ind.—It is stated that bids will be received by the Co. Comrs. at Danville until Sept. 2, for construction of Hazelton-Hadley bridge in Guilford Township.

Indianapolis, Ind.—Bids will be received until Aug. 28 by the Bd. Pub. Wks. (Jos. T. Elliott, Pres.), for constructing a retaining wall at the W. Washington St. bridge over White River.

* *Items marked thus give the names of parties awarded contracts.*

Wichita, Kan.—Bids will be received until Sept. 9 by the Bd. Co. Comrs. (E. P. Martin, Chmn.) for furnishing material and constructing a reinforced concrete bridge over the Arkansas River on Douglas Ave. Plans and specifications may be had upon a deposit of $10. Geo. H. Bradford, Engr., Wichita.

Millbury, Mass.—The citizens are reported to have voted on Aug. 19 to issue $3,500 bonds for building a reinforced concrete bridge over Blackstone River at S. Main St. A committee has been appointed on same with Fred W. Moore, Chmn.

Greenfield, Mass.—Bids will be received by the Bd. of Selectmen (E. B. Blake, Chmn.). until Aug. 31 for the construction of a reinforced concrete highway bridge of 25-ft. span and 20-ft. roadway over Hinsdale Brook on Green River Road, as advertised in The Engineering Record. Engineers Clapp & Abercrombie Co., 90 Main St., Greenfield; probable cost, $1,400.

Vicksburg, Miss.—It is stated that bids will be received by the Bd. of Co. Superv. (J. D. Laughlin, Clk.), and the Bd. of Aldermen, until Sept. 4, for construction of concrete arch bridge over Glass Bayou at Cherry St., and concrete-steel bridge at City Cemetery Road, near Rigby Place. H. J. Trowbridge, City Clk.

Albany, Mo.—W. A. Henton, of Albany, County Surveyor, writes that he will receive bids until Sept. 3 for the construction of a 180-ft. steel bridge on old piers, 162-ft. span on tubes, 80-ft. approach, two 20-ft. I-beam spans and one 24ft. I-beam span, all to be steel, except floor.

Laurel Springs, N. J.—Bids will be received until Sept. 9 by the Bd. of Freeholders at Camden (Geo. W. Whyte, Chmn.), for constructing an iron truss bridge 64 ft. long over Laurel Lake at Laurel Springs. J. J. Albertson, Co. Engr.

Rahway, N. J.—Bids will be received until Sept. 4 by the Bd. of Chosen Freeholders at Elizabeth, for the construction of a reinforced concrete bridge at New Church St., Rahway, over Robinson Branch of the Rahway River.

Le Roy, N. Y.—The citizens are stated to have voted to construct a bridge over the Oatka River at Main St., at a cost of $20,000.

Long Island City, L. I., N. Y.—Bids will be received by J.W. Stevenson, the Comr. Bridges, until Sept. 5, for the construction of the steel and masonry approach, in the Boro. of Queens, of the Blackwell's Island Bridge over the East River, between the Boros. of Manhattan and Queens.

Cincinnati, O.—The following bids are reported opened Aug. 16 for reconstructing the Liberty St. Viaduct: Strobel Steel Constr. Co., Monadnock Blk., Chicago, Ill., $173,000, and T. J. Brackett, $175,000. Appropriation available, $139,000.

St. Clairsville, O.—It is stated that bids will be received until Sept. 2 by A. W. Beatty, Co. Aud., for constructing the substructures and superstructures of sundry bridges and culverts.

Eaton, O.—It is stated that bids will be received until Sept. 5 by C. W. Eidson, Co. Aud., for constructing the superstructures of sundry bridges.

Cleveland, O.—Bids will be received until Sept. 14 by the County Comrs. (Julius C. Dorn, Clk.). for constructing concrete steel bridge in Strongsville Township as per report 1639.

Chandler, Okla.—Bids will be received until Sept. 2 by the Bd. Co. Comrs., at the office of J. E. Rea, Co. Clk., for furnishing material and constructing 4 steel bridges in this county.

Towanda, Pa.—Bids will be received by the Bd. Co. Comrs. (E. D. Harkness, Chmn.) at Towanda, until Aug. 29, for constructing a 46-ft. plate girder bridge, with 24-ft. roadway across Sugar Creek, Troy Borough; also a bridge across Sugar Creek between Troy and West Burlington Townships. Bids on latter bridge to be on either a truss span 86 ft. center to center, 14-ft. roadway or a concrete arch bridge.

Pittsburg, Pa.—An ordinance is stated to have been passed authorizing the Mayor and Dir. Dept. Pub. Wks. to receive bids for repairing Center Ave. Bridge over Pennsylvania R. R. tracks; at a cost of $7,000.

It is stated that the Wabash R. R. Co. (A. O. Cunningham, Ch. Engr., St. Louis, Mo.), plans to construct a bridge over W. Carson St. in the West End for the Westside Belt R. R. Co.

Decatur, Ind.—It is reported that the Bd. Co. Comrs. will receive bids until Sept. 6 for the construction of a macadamized road in Monroe Township known as the Bollinger Macadam Road No. 4; also a gravel road in Preble Township known as the Fred. Blomberg Road. C. D. Lawton, Co. Aud.

Bloomington, Ind.—It is reported that the Bd. Co. Comrs. will receive bids until Sept. 4 for the construction of pike roads Nos. 1, 2, 3 and 4, in Salt Lake Township; total aggregate length, 12,290 ft. Sam'l M. Kerr, Co. Aud.

Lebanon, Ind.—It is reported that the Bd. Co. Comrs. will receive bids until Sept 24 for constructing a gravel road known as the Ezra Good Road. B. F. Simmons, Co. Aud.

*Boonville, Ind.—The County Comrs. on Aug. 6 are stated to have awarded contracts for constructing 4 rock roads in Campbell Township to Pelzer & White for $24,256.

Greencastle, Ind.—It is stated that bids will be received until Aug 31 by C. C. Hurst, Co. Aud., for macadamizing 13,000 ft. road; also same date for macadamizing 15,633 ft. of road. V. E. McCammack, Chmn. Bd. Co. Comrs.

South Bend, Ind.—The Council has passed resolutions for brick pavements on Park Ave., Grand View and Ford St., about 3,000 sq. yds.; also for 104,000 sq. ft. of cement walk and 25,000 ft. concrete curb. A. J. Hammond, City Engr.

*G. C. Sageman, of South Bend, has secured the contract for brick pavement on Bway. for $11,426.

Valparaiso, Ind.—It is stated that bids will be received until Sept. 2 by Stephen P. Corboy, Co. Aud., for constructing a stone road.

Salem, Ind.—It is stated that bids will be received until Sept. 2 by the Co. Comrs. for constructing the old state road in Gibson Township.

Covington, Ind.—It is stated that bids will be received by the Co. Comrs. until Sept. 3, for constructing 4 stone pikes aggregating 9½ miles in length and two gravel roads, about 5 miles in length. W. B. La Baw, Veedersburg, Co. Surv.

Des Moines, Ia.—The following bids are reported recently received for 36,000 sq. yds. brick paving as follows: *a* W. 12th St. *b* Des Moines St., *c* W. Court Ave., *d* W. 2d St., *e* W. 5th St.: O. P. Herrick, *a* $2.09, *c* $2.03, *d* $1.585. *e* $2.09; Jas. Horrobin, *a* $2.15, *b* $2.145. *d* $1.63; J. W. Turner Improvement Co., *b* $2.17; Geo. M. King, *b* $2.25; J. W. Campbell *c* $1.49 (price given per sq. yd.).

*The Bd. Pub. Wks. is stated to have awarded the contract for paving 19,450 sq. yds. with vitrified paving brick on Forest Ave. to Jas. Horrabin at $1.97 per sq. yd. (bids opened Aug. 7).

It is stated that all bids opened by Bd. of Pub. Wks. Aug. 7 for paving 4,160 sq. yds. on 6th Ave., have been rejected. According to reports new bids will be received.

Bids will be received until Sept. 13 by the Bd. Pub. Wks. (W. W. Wise, Chmn.) for improving Library Ave., requiring about 1,084 sq. yds. asphalt pavement and about 562 lin. ft. curb.

*Hutchinson, Kan.—An additional contract for 5,543 sq. yds. of bitulithic has been awarded to the Kansas Bitulithic Co., of Kansas City, Mo.

Independence, Kan.—J. D. Kramer, City Clk., writes that it is proposed to pave about 23 blocks with brick. Nothing definite yet done. W. F. Keller, City Engr.

Greensburg, Ky.—L. W. Coakley, Treas. Green County Turnpike Co., writes that the contract was not let on Aug. 13 for constructing about 11 miles of pike. The matter has been postponed indefinitely.

Baltimore, Md.—Bids will be received until Aug. 28 by the Bd. Awards (J. Barry Mahool, Pres.) to grade, curb, gutter and pave with macadam a portion of Chelsea Terrace.

*The Bd. of Awards is stated to have awarded contracts for paving as follows: Lombard St. with brick, to Patrick Reddington, 325 St. Paul St., for $2,262, and Robert Ave. with brick to F. E. Schneider, at $10,957.

It is stated that the Bd. of Awards approved the specifications providing for the paving of a portion of Chelsea Terrace.

Stockton, Md.—Bids will be received until Sept. 3 by the Bd. Co. Comrs. at Snow Hill, for improving the public highways between Stockton and George's Island and between Stockton and Snow Hill, known as the George's Island and the Stockton-Snow Hill Roads, respectively. J. Edwd. White, Co. Treas.

Boston, Mass.—Bids will be received until Aug. 27 by the Massachusetts Highway Comn., Boston (W. E. McClintock, Chmn.) for constructing about 3,800 ft. of road in town of Barnstable and 4,500 ft. of road in town of Methuen and city of Haverhill.

*Lynn, Mass.—An additional contract for 3,938 sq. yds. of bitulithic has been awarded to Warren Bros. Co., of Boston.

Fall River, Mass.—Highway Improvement bonds amounting to $20,000 are reported sold.

*Detroit, Mich.—The Central Bitulithic Co., of Detroit, has received contract for 5,276 sq. yds. of bitulithic.

St. Paul, Minn.—Bids will be received by the Bd. Co. Comrs. until Sept. 16 for improving a portion of Larpenteur Ave. Edwd. G. Krahmer, Co. Aud.

Kansas City, Mo.—Bids will be received until Aug. 29 by the Bd. Pub. Wks. for furnishing material and constructing asphalt pavements on portions of 5 streets and constructing artificial stone sidewalks on portions of 8 streets.

Independence, Mo.—An additional contract for 1,600 sq. yds. of bitulithic has been awarded to the Kansas Bitulithic Co., of Kansas City, Mo.

Billings, Mont.—This city is preparing plans for two paving contracts, one to cost $103,000 and the other $20,000. Henry Gerharz, City Engr.

*Helena, Mont.—Adami Bros. are stated to have secured the contract (bids opened Aug. 5) for grading Le Grande Boule., at $3,285.

*Butte, Mont.—R. M. Bardsen secured contract on Aug. 11 for paving N. Main St., 2 blocks, with granite block, at $6.65 per sq. yd.

Alex. Leggat, City Engr., writes that bids will probably be called for about Mar. 1 for paving, to cost about $100,000.

Concord, N. H.—Bids will be received until Aug. 28 by A. W. Dean, State Engr., for grading and surfacing with gravel a portion of the Newmarket Rd. in the town of Durham, and the main road in the town of Middleton.

*Plainfield, N. J.—Andrew J. Gavett, City Surveyor, writes that C. M. Meeker, of Plainfield, has secured the contract for paving (bids opened Aug. 5), at the following bid, using Brady's Run brick for paving: W. Front and E. Front Sts. and Watching and Park Aves., $2.38 pr. sq. yd. and Somerset St. and E. 4th St. and Arlington Ave., $2.40 per sq. yd.; 1,035 lin. ft. new curb 60 cts.; 1,400 lin. ft. curb reset, 20 cts.; 300 lin. ft. drain tile, 20 cts.; 150 lin. ft. 18-in. surface drain, $1; 365 lin. ft. of 15-in., 80 cts.; 250 lin. ft. 12-in., 60 cts.; 2 manholes, ea., $45; 7 inlets, ea., $20; total, $39,441. Totals of other bids received: Eveline Bros., New Britain, Conn., $55,536; Russell Contr. Co., New York, N. Y. (3 bids using different kinds of brick), $44,337, $46,390 and $44,568; M. Noonan, Germantown, Pa., $44,352; Reeves Smith, New Britain, Conn., $44,515; John F. Kerwin & Co., New Brunswick, N. J., $43,889; Hassam Paving Co., Worcester, Mass. (4 bids), $40,261, $37,734; $43,209 and $38,366; T. J. McGovern, Trenton, $36,743.

Camden, N. J.—The City Council is reported to have passed an ordinance providing for the paving of a portion of Jefferson Ave.

*Newark, N. J.—A contract for 18,150 sq. yds. of bitulithic has been awarded to the Standard Bitulithic Co., of New York, N. Y.

Bridgeton, N. J.—Bids will be received until Sept. 11 by Geo. Reeves, Chmn. Pub. Road Com., Bd. Chosen Freeholders at Court House, Bridgeton, for improving a road in Landis Township, about 5¾ miles in length. Approximate quantities: 16,420 cu. yds. earth excav., 9,232 cu. yds. compact gravel; arch bridge at Burn Mill stream; 10 ft. additional to present bridge at Blackwater stream; box culvert 2½ ft. x 20 ft. at station No. 215. Walter M. Sharp, Co. Engr., Bridgeton.

Riverton, N. J.—Bids will be received until Aug. 28 by the Highway Com. (Edwd. H. Fancoast, Chmn.), for furnishing material and constructing about 30,000 sq. ft. cement paving and for grading, graveling or sodding about 8,000 sq. yds. sidewalk. Henry S. Haines, Boro. Engr., 306 Temple Bldg., Camden.

Elmira, N. Y.—Bids will be received until Sept. 4 by the Bd. Pub. Wks. for paving portions of Railroad Ave. with vitrified block and asphalt on a concrete foundation, in all about 2,200 sq. yds. paving and 2,090 lin. ft. curbing, as advertised in The Engineering Record.

Brooklyn, N. Y.—Bids will be received until Sept. 4 by Bird S. Coler, Boro. Pres., for regulating, grading and paving with asphalt a portion of Roebling St., repaving with granite a portion of Plymouth St. and laying sidewalks on portions of President and 39th St. and Prospect Pl. Engineer's estimate: 18,620 sq. yds. asphalt pavt.; 3,700 sq. yds. granite blk. pavt., with tar gravel and joints; 102,105 sq. ft. cement sidewalk; 13,235 lin. ft. new curb, etc.

Buffalo, N. Y.—Separate bids will be received until Sept. 4 by the Dept. Pub. Wks. (F. G. Ward, Comr.) for paving and repaving portions of 10 streets.

Jamestown, N. Y.—Bids will be received until Sept. 2 by the Bd. of Estimate and Review (F. A. Dorman, Chmn.), for furnishing material and constructing approximately 23,000 ft. of cement curb and gutter, 36 concrete catch basins and 10 manholes. C. G. Jones, City Engr.

*Syracuse, N. Y.—The Bd. of Contract and Supply on Aug. 13 is stated to have awarded the contract for paving Plum St. with Johnsonburg block to Fred J. Baker, for $15,228.

Cohoes, N. Y.—Bids will be received until Sept. 3 by the Common Council for paving and curbing with new or second-hand granite blocks, portions of Olmstead and Factory Sts.; also constructing a concrete sidewalk on the Cohoes Co.'s Canal at North Mohawk St., known as Black Bridge. Chas. H. Van Auken, City Engr.

*Ilion, N. Y.—The Bd. of Street Comrs. is stated to have awarded the contract for paving a portion of Main St. to John R. Baxter, of Utica, at $7,448.

*Hempstead, L. I., N. Y.—The Highway Comrs. of Hempstead are stated to have awarded to Andrews Bros., of Mineola, the contract for macadamizing Elmont Road, at a cost of $17,154.

* *Items marked thus give the names of parties awarded contracts.*

New York, N. Y.—Bids will be received by the Park Board (Moses Herrman, Pres.), New York City, until Aug. 2, for paving with sheet asphalt upon a concrete foundation the carriageway, for furnishing and setting where required new curbstones, and resetting elsewhere the existing curbstones, and for alterations to the drain age, all in 5th Ave., bet. 50th and 60th, and bet. 90th and the Plaza at 110th St.; for paving and repaving with rock asphalt mastic where directed, the walks of Central and other parks; repaving where directed the cement walks of small parks, all in Boro. Manhattan; also same time and place, furnishing and delivering two steam road rollers to the Dept. Parks, Boroughs of Brooklyn and Queens.

Bids will be received by Moses Herrman, Pres. Park Bd., until Aug. 20, for furnishing and delivering North River road gravel for drives in Central Park.

**New York, N. Y.*—The Sicilian Asphalt Paving Co. has secured contract for repairing the asphalt pavement between north side of W. 20th St. and a point about 150 ft. north of north side of Pier (new) 29, near the ft. of Vestry St., North River, at $1.55 and $1.88 per sq. yd. and the Uvalde Asphalt Paving Co., secured contract for repairing asphalt pave bet. Battery Pl. and a point about 140 ft. north of the north side of Pier (new) 29, near the ft. of Vestry St. North River, and asphalt pavement on East River, at $1.60 and $1.65 per sq. yd. (bids opened Aug. 14 by J. A. Bensel, Com. of Docks).

C., Aug. 27, to furnish at the navy yards and naval stations a quantity of naval supplies, as follows: Portsmouth, N. H., Sch. 165—Band saws, planer and joiner. Sch. 209—Dump tubs. Sch. 211—Steam pipe, pipe fittings, angle and gate valves. Boston, Mass., Sch. 220—Tools, hose-gate valves, steel, etc. New York, N. Y., etc., as follows: Sch. 209—Wire lath, galvanized iron wire and bolts. Sch. 210—Steel. Sch. 212—Drilling machine. League Island, Pa., Sch. 210—Steel rails. Sch. 211—Iron pipe, pipe fittings, etc. Naval Academy, Annapolis, Md., Sch. 166—Pipe cutting and threading machine, turbo-generator. Washington, D. C., etc., Sch. 213—Motors. Sch. 214—Milling attachment, pneumatic drills and hammers, brass tubes, armor plates. Sch. 224—White pine. Norfolk, Va., Sch. 208—Electrical instruments, battery cells, electrical supplies, etc. Sch. 209—Tool grinders, condenser, drills, etc. Sch. 215—Electric spares. Sch. 218—Electric wire and cable, volt-meters. Sch. 220—Brass pipe, galvanized iron thimbles. Charleston, S. C., Sch. 164—Traveling crane. Sch. 165—Rotary shear, band saw machine. Sch. 215—Motor drive. Key West, Fla., Sch. 202—Portland cement, steel wire fabric, yellow pine. New Orleans, La., Sch. 204—Pressure blower, forges, oil pumping apparatus, tools. Sch. 205—White and yellow pine, cypress, rolled bronze, iron, steel. Applications for proposals should designate the schedules desired by number. E. B. Rogers, Paymaster Gen'l, U. S. N.

Millen, Ga.—It is stated that bids will be received about Sept. 12 by H. O. Bell, Mayor, for an electric light and water plant for this place. Probable cost, $30,000. J. B. McCrary & Co., Engrs., Atlanta.

Rathdrum, Idaho.—Rathdrum Electric Co. contemplates erecting new transmission lines and installing new trans formers. H. R. Saunders, Mgr.

Lewiston, Idaho.—The Lewiston Gas Co. is reported to have decided to install two new retorts, and extend the mains.

Huntingburg, Ind.—The Miessuer Bros. Co. will install a new 175-kw. generator and an engine of 250 h.-p. F. G. Katterbury, Mgr.

Churubusco, Ind.—A new alternator will be installed in the plant of the Churubusco Water & Light Co. this fall. Miss T. Kingdon, Owner and Mgr.

Lebonon, Ind.—The Citizens Electric Light & Ice Co. is said to be contemplating increasing capacity of plant, and will install a 175-kw. 3-phase, 60 cycle 2,200-volt generator and a 250 h.-p. Deisel engine. G. H. Wing, Mgr.

Martinsville, Ind.—The citizens are contemplating making improvements to the municipal electric lght plant, which include the installation of a new dynamo, engine and new lamps. B. E. Lewis, Mgr.

Weleetka, Ind. Ter.—The Weleetka Light & Water Co. is said to be planning extensive additions and improvements to its water works system to include 80 h.-p. pump, 80,000 gal. tank and 6,000 gal. reservor, and may install a 200-kw. dynamo. D. F. Campbell, Mgr.

Guthrie Center, Ia.—Plans are being made by the Guthrie Center Electric Light Co. to increase capacity of plant this fall. An engine, generator and two transformers will be installed.

Britt, Ia.—The Britt Light & Power Co. is said to be contemplating installing a street lighting circuit for incandescent lamps, and will erect a pole line for 50 lamps. L. M. Goodman, Mgr.

New London, Ia.—The citizens are contemplating extending the municipal electric lighting system to Danville to supply the village with electricity for lighting purposes. Gilbert Johnson, Mgr.

Burlington, Ia.—The Burlington Electric Light & Power Co. is said to be making arrangements to install a 60 h.-p. gas engine and alternator.

St. Ansgar, Ia.—The Wood Working Co. proposes changing its electric plant from steam to water power. C. H. Miller, Mgr.

Corroll, Ia.—Geo. H. Long, of Grand Rapids, Mich., is reported to have purchased electric light plant and will improve same.

**Sioux City, Ia.*—A. A. Smith, City Clerk, writes that the contract for lighting the streets by electricity (bids opened Aug. 6), has been awarded to the Sioux City Gas & Electric Co. of Sioux City, for 10 years at $75 per lamp for 2,000 c. p. arc, and $20 for 32 c. p. incandescent lamps.

Garnett, Kan.—The Garnett Electric Light Co. has in contemplation the establishing of a fan circuit. G. B. State, Mgr.

Iola, Kan.—Extensions and improvements are contemplated to the municipal electric lighting plant, to include installation of a 150 h.-p. tubular boiler, and a 100 kw. alternating-current, 2,200-volt 60-cycle generator. W. E. Rutledge, Supt.

Caney, Kan.—The Caney Electric Light & Power Co. is considering the question of installing a 150-kw. 1,100-volt generator. John Heckman, of Coffeyville, Mgr.

Princeton, Ky.—The Princeton Light & Power Co. is contemplating installing 47 additional street arc lamps. G. G. Flower, Mgr.

London, Ky.—Plans are reported as being made to install a new engine in the plant of the London Elecrtic Light & Power Co. W. F. Raymer, Mgr.

Mayfield, Ky.—The Mayfield Water & Light Co. is said to be contemplating an extension of 4 miles to its streets lighting service, and 6 miles of water mains.

Paris, Ky.—The Paris Eectric Light Co. is contemplating increasing the capacity of its plant, and establishing a day service. The company will install an engine and hoiler. L. S. Allen, Mgr.

Uniontown, Ky.—Tht Uniontown Light & Power Co. is planning to install an additional boiler in its plant. G. F. Cecil, Mgr.

Richmond, Ky.—The Richmond Electric & Power Co. proposes installing a 150 h.-p. hoiler. A. J. Forbes, Mgr.

Sturgis, Ky.—The West Kentucky Coal Co. contemplates adding new machinery to its electric power plant. W. A. Chandler, Mgr.

* *Items marked thus give the names of parties awarded contracts.*

Lake Charles, La.—The Lake Charles Ice, Light & Water Works Co. is contemplating installing a 100-kw. Westinghouse-Parsons turbo-generator set and a 300 h.-p. boiler in its plant in Sept. T. J. Bird, Mgr.

South Berwick, Me.—The Berwick & Salmon Falls Electric Light Co. is said to be contemplating about 20 miles of extension to its lines. E. E. Proctor, of Wakefield, Mass., Mgr.

Oakland, Md.—The Youghiogheny Light & Power Co., of Garrett County, is reported to have been incorporated at Oakland. It is proposed to locate a power plant below Deep Creek Falls, 7 miles north of Oaklank, at which point the wasted water power of the Swallow Falls in Yough River, the Deep Creek falls and the Muddy Creek falls nearby, wil be concentrated and utilized for the purpose of generating power. It is proposed to supply electric light to Oakland, Mauntain Lake, Deer Park, Grantsville, Accident, Friendsville and other towns in Garrett County, Kingwood and other towns in West Virginia and towns on the southern border of Pennsylvania. It is the purpose also to supply power for proposed trolley roads, one of which would run from Frostburg to Uniontown, over a section of the old National pike.

Baltimore, Md.—Bids will be received until Aug. 28 by the Bd. Awards (J. Barry Mahool, Pres.) for the electrical equipment for the illumination of Baltimore St. Robt. J. McCuen, Supt. Lamps and Lighting.

Boston, Mass.—Bids will be received until Aug. 30 by the Schoolhouse Comn. (R. Clipston Sturgis, Chmn.), 120 Boylston St., for installing electrical system in extension to Mechanic Arts High School, Scotia St. Wheelwright & Haven, Archts., 220 Devonshire St.; French & Hubbard, Engrs., Albany Bldg.

L'Anse, Mich.—C. D. Shea, Village Clk., writes that bids will be received until Sept. 3 for the construction of the proposed water power plant. Engineer, E. P. Burch, of Minneapolis, Minn.

Minneapolis, Minn.—The City Council has passed an ordinance providing that the city estimates for next year include an item of $500,000 for a lighting plant.

Hattiesburg, Miss.—The Union Electric Co., of Hattiesburg, has applied for a charter, with a capital of $5,000. A. N. Sexton and C. J. Sutherland, of Hattiesburg, are reported interested.

Helena, Mont.—S. T. Hauser, former Governor of Montana, is reported interested in the construction of a third dam across Missouri River for the development of electrical power, a portion of which will be utilized for a pumping plant, which will reclaim 35,000 acres of land in Prickly Pear Valley, below the city; probable cost of proposed work, $1,000,000.

Stevensville, Mont.—Geo. I. Walters, of Victor, is reported interested in the development of water power here and the installation of an electric light plant.

**University Place, Neb.*—R. E. Shelley, City Clk., writes that the contract for constructing an electric light plant (bids opened July 27) has been awarded to Bicker & Lowell, of University Place, for $3,890.

Tekamah, Neb.—The citizens are reported to have voted to issue bonds for the construction of an electric light plant.

Wood River, Neb.—D. D. O'Kane, Village Clk., writes that contract will probably be let in about 30 days for the construction of water works and an electric light plant.

Paulsboro, N. J.—Bids will be received by Chas. M. Gwilliam, Boro. Clk., until Aug. 29 for the installation of a gas plant, as advertised in The Engineering Record. Engineer Wm. H. Boardman, 426 Walnut St., Philadelphia, Pa.

Bids will be received until Aug. 29 by Chas. M. Gwilliam, Boro. Clk., for $35,000 gas bonds.

Secaucus, N. J.—Bids will be received until Aug. 29 by the Boule. Comrs. (John Sweeney, Clk.), 580 Newark Ave., Jersey City, for the work of dismantling, moving forward, resetting and repairing 4 boilers; installing separator, valves, and refitting steam pipes, etc., to same, at the Power House, Secaucus.

New York, N. Y.—Bids were opened on Aug. 15 by John H. O'Brien, Com. Water Supply, Gas & Electricity, for furnishing, maintaining and installing power, etc., at pumping stations as follows: The New York Edison Co., Elm and Duane Sts., bids Furman and Joralemon Sts., and Willoughby and St. Edwards St. stations, Brooklyn Boro., 1½ cts. per kw. hour and $3,660 per mo. for installing, maintaining, etc. of same, and at Oliver and South St. and Gansevoort and West Sts. stations Boro. of Manhattan, 2½ cts. per kw. hour and $6,500 per month for furnishing, installing, etc.

Brooklyn, N. Y.—Bids will be received until Sept. 4 at the Bureau Yards and Docks (R. C. Hollyday, Ch.), Navy Dept., Washington, D. C., for furnishing 15 motor-generator sets and accessories for the Navy Yard, Brooklyn, N. Y., as per specification No. 1560. Est. cost, $72,000.

Irondequoit, N. Y.—The Rochester Ry. & Light Co., of Rochester, is reported to have secured franchise to supply heat, light and power to the town of Irondequoit; estimated cost of this improvement is $20,000.

Albany, N. Y.—John R. Freeman, Providence, R. I., has been retained by the State Water Supply Commission to investigate the water power resources of the State and outline plans for developing some of the powers. New York, unlike most other States, owns the heds of most inland streams, and can undertake power developments without spending large sums to acquire ownership. It is proposed to organize several field parties immediately.

Little Valley, N. Y.—M. L. Ansell, Village Clerk, writes that bids will be received on Aug. 30, for improvements to the electric light plant, probable cost of work, $10,000. Engineer G. S. Boller, of Little Valley.

Blackwell's Island, N. Y.—The following are the bids opened on Aug. 15 by Robt. W. Hebberd, Com. of Pub. Charities, N. Y. City, for furnishing material and installing complete electric lighting and power system for all buildings and grounds under Dept. of Public Charities, and comprising City Hospital Dist. Blackwell's Island, Boro. of Manhattan: (*a*) Aggregate price for whole work, and embracing entire completion of work. (*b*) Aggregate price for whole work as modified by the Alternate installing underground conduit lines with service boxes, manholes, transformers vaults and the like complete: Ideal Electrical Constr. Co., 1133 B'way, *a* $68,920, *b* $120,700; Thompson Bonney Co., 45 York St., Bklyn. *a* $72,360, *b* $126,940; T. Blanchard, 142 5th Ave., *a* $69,440, *b* $122,345.

Rocky Mount, N. C.—Bids will be received until Sept. 1 by W. L. Thorp, Mayor, for $135,000 water, light and street improvement bonds.

Tryon, N. C.—G. Hamilton Holmes, of Tryon, Ch. Engr. Tryon Electric Light & Power Co., writes that plans for the proposed development have been changed and a larger plant is now proposed; probable cost $110,000.

Springfield, O.—The stockholders of the new north side lighting and heating company, are reported to have on Aug. 13 decided to incorporate with a capital of $50,000. The name of the company is not yet decided upon. The site for plant has been purchased and contract will soon be let for the erection and equipment. A. J. Eisenmayer, is acting chairman of company.

Arlington, O.—It is reported that bids are wanted until Aug. 27 for constructing an electric light plant. O. T. Castor, Village Clk.

Bucyrus, O.—It is reported that preliminary plans are being prepared for a municipal electric light plant.

Columbus, O.—Bids will be received until Sept. 17 by the Bd. of Trus. of the Columbus State Hospital (Geo. Stockton, M. D., Secy.), for furnishing and installing complete at the power house at the said hospital an engine, dynamo and switch board. Frank L. Packard, Archt., Columbus.

El Reno, Okla.—The Canadian Light, Heat & Power Co. is reported incorporated, with a capital of $100,000, by Henry Schafer, J. W. Many, and others.

Eugene, Ore.—Geo. M. Miller, of Eugene, writes that it is proposed to construct a power plant at Swisshome, to cost between $50,000 and $100,000. Joaquin Miller, of Diamond, Cal., is also reported interested.

Corvallis, Ore.—Wm. H. Adams, Secy. of the Oregon Gas Mfg. Co., Room 401 Tilford Bldg., Portland, writes that this company has secured a franchise for the construction of a gas plant and the installation of necessary pipe line system. It has option on present water pipe line system with about 7 miles of pipes. It is proposed to utilize these pipes and to add to same about 3 miles of pipe before winter. Tihs company also proposes supplying gas to the cities of Astoria, Salem, Baker City, Pendleton, La Grande, and other cities, and has also received a franchise in Albany, Ore., and will install about 10 miles of pipe. Within a year the company will have nearly 100 miles of pipes reaching the nearby towns.

Bend, Ore.—We are informed that the city has in contemplation the question of purchasing present electric plant, and installing a gravity water system. H. C. Ellis, City Recorder.

Panama.—See "Miscellaneous."

Elizabethtown, Pa.—The Boro. Council is reported to have granted an electric light franchise to the Elizabethtown & Marietta Electric Light Co.

Philadelphia, Pa.—The United Gas Improv. Co. is reported to have decidd to expend about $2,000,000 in improvements to include construction of holders in West Philadelphia, with a capacity of 3,000,000 cu. ft. and a 30-in. main from Point Breeze works to storage plant at 9th and Norris Sts.

Finleyville, Pa.—Charters are reported to have been granted to the Finleyville Electric Light Co. and the Courtney Electric Light Co., each with a capital of $5,000. The incoporators are the same in both companies as follows: Jacob V. Van Wagener, John F. Cockhurn and Clarence W. Scheck, all of Pittsburg.

Gary S. D.—Oscar Claussen, of St. Paul, Minn., is reported to be preparing plans for the proposed electric light plant. T. M. Anton, Town Clk.

Columbia, Tenn.—The City Council is reported to be considering the question of improving the electric light plant.

Park City, Tenn.—The City Council has adopted on final reading the ordinance and contract with Knoxville Ry. & Light Co., of Knoxville, providing for lighting Park City with 20 arc lamps.

**Knoxville, Tenn.*—Press reports state that W. J. Oliver, of Knoxville, will receive contract to construct the dam, canal tunnel and power house on Little Tennessee River for the Knoxville Power Co., for about $2,500,000.

Ashland, Wis.—The only bid recently received for the construction of the municipal electric light plant is stated to have been submitted by W. E. Ule, of Stevens Point, for about $130,000. It is stated that new bids will be called for.

ELECTRIC RAILWAYS.

Notes Arranged Alphabetically by States.

Sacramento, Cal.—The Sacramento & Lake Tahoe Ry. Co. is reported to have filed several notices of location in Placer County for water rights, dam and reservoir sites, etc., on the middle fork of the American River, for the storage of water for the generation of electric power. The railway will cross the American River near Folsom, and use the old railroad grade at the Owen King place, running east of Loomis and continuing up through Long Valley.

Lakeport, Cal.—It is stated that the Sonoma & Lake County R. R., which has been granted an exclusive franchise by the Lakeport Bd. of Trustees, is about to build an electric railway from Lakeport to Cloverdale, which will pass through Adams Springs, Highland Springs, Saratoga and Bartlett. The company will commence the construction of the line as soon as arrangements are completed for a connection with San Francisco. The line will cover a distance of 27 miles, will handle passenger and freight traffic and will cater to tourist trade. The company is composed of nine Lake County and Ukiah capitalists, who hold the entire 10,00 shares. J. F. Fulton, Genl. Mgr.

St. Augustine, Fla.—It is stated that the St. Johns Light & Power Co. (J. F. Miller, Ch. Engr.) expects to build about 5 miles of track during the next three months. It is said that the company will also purchase considerable rolling stock.

Danville, Ill.—The Danville & Eastern Illinois Ry. Co. certified to an increase of capital from $5,000 to $500,000. This road is to be built from Danville to Terre Haute, Ind.

Chicago, Ill.—The Chicago & Interurban Ry. Co., with a capital of $100,000, is reported to have secured a license to incorporate. The road is to be constructed from Chicago south through Harvey, South Holland, Calumet, Thornton, Chicago Heights, Crete, to Joliet, Blue Island, Riverdale, Dalton, Hammond and other towns. Incorporators: J. W. McGill, John W. Humphrey, Claude E. Fitch, L. E. Eaton, J. M. Miller, H. D. Moreland and Fred F. Myers.

Evansville, Ind.—The Evansville & Mt. Vernon Traction Co. is stated to have decided to ballast the line between this city and Mt. Vernon with broken stone and make a number of improvements.

Muscatine, Ia.—It is stated that a survey is under way for a projected electric railway to Davenport. It is reported that R. A. Roberts, of St. Louis, Mo., is interested.

Parsons, Kan.—The City Council is stated to have granted C. L. Brinser a franchise for a street railway line which is to be part of an interurban system. There will be two lines, one extending north to Chanute and Pittsburg, and the other south to Altamount and Edna, and then on to Coffeyville.

Danville, Ky.—The Danville Light, Power & Traction Co. is reported to be considering the construction of an electric railway here and a line taking in Lancaster, Stanford, Hustonville, Junction City and Harodsburg.

Somerset, Ky.—The Somerset & Nashville R. R. Co. is reported incorporated, with a capital of $10,000, to build an electric railway from Somerset to Nashville.

**Boston, Mass.*—The Boston Transit Comn. has awarded the contract for constructing entrance and exit at Water and Devonshire Sts. (bids opneed Aug. 15) to Coughlan & Sheets Co., 104 Hanover St., for $2,686.

Kirkwood, Mo.—Extensive improvemnts are reported under way on the Hodiamont branch of the United Railways Co. system. The entire line from De Hodiamont to Kirkwood will be practically rebuilt.

Ithaca, N. Y.—The Common Council is stated to have granted a franchise to the Ithaca St. Ry. Co. (J. N. Bennett, Ch. Engr.) for a double track.

Asheville, N. C.—The towns of Waynesville and Canton will be connected by an electric railway, according to reports. It is stated that the Champion Fibre Co., of Canton, is interested in the project. The distance between the two places is about 10 miles.

Grand Forks, N. D.—The incorporation of the Northwestern Interurban Ry. Co. with a capital of $1,000,000, for the purpose of building electric railways in Grand Forks and Crookston, an interurban line connecting the two cities, and a line eastward from Crookston to connect with the Soo is reported under consideration by J. L. Lambrecht, Pres. Traction Securities Co., and Dr. Stewart, both of Minneapolis, Minn.

Mansfield, O.—The Massillon, Wooster & Mansfield Traction Co. is reported incorporated, with a capital of $10,000, by G. A. Bartholomew, W. C. Rhodes, J. H. Cousins and E. R. Lewis. The purpose of the company is to build and operate an electric railway between Mansfield and Massillon through Richland, Ashland, Wayne and Stark Counties.

Spring City, Pa.—It is stated that the Montgomery & Chester Electric Ry. Co., operating an electric line between Spring City and Phœnixville, has decided to erect a bridge over the Pickering Valley Railroad at Ironsides.

Pottsville, Pa.—A proposed route is stated to have been outlined for an electric railway from Pottsville to Glen Carbon, through Barry, Hegins and Hubley Townships, of Schuylkill County, and then through Dauphin County to Millersburg. The distance from Glen Carbon to Harisburg is 38½ miles, and the cost to build this road would be about $1,500,000. W. E. Harrington, Pres., of the Eastern Railways Co., is reported interested.

Tarentum, Pa.—A franchise is stated to have been granted the Tarentum, Saxonburg & Butler St. Ry. Co.

Dravosburg, Pa.—The Council of Dravosburg is reported to have passed an ordinance giving the Dravosburg St. Ry. Co. rights in the borough.

Waynesboro, Pa.—The Chambersburg, Greencastle & Waynesboro St. Ry. Co. and the Blue Mountain House Co. are reported to have under consideration the construction of an electric railway extension from Pen Mar to the Blue Mountain House and High Rock.

Scranton, Pa.—It is stated that the Northern Electric St. Ry. Co. will soon build a steel viaduct 500 ft. long, also 6 miles of rail and overhead construction.

Anderson, S. C.—The link in the electric railway operated by the Anderson Traction Co. necessary to join Belton, Greenville and Anderson will be built at once, it is stated. Geo. E. Coughlin, Gen. Mgr.

Memphis, Tenn.—The South Memphis Traction Co. is stated to have applied to the County Register for a charter to construct several new lines in South Memphis. According to oresent plans five lines will be built, two from Memphis to South Memphis. Another line is to be a cross line going from the river up Mallory Ave to Lauderdale, at which point a connection will be made with the line recently completed by the Memphis St. Ry. Co. James F. Hunter, W. E. Gage, W. G. Thomas and others are reported interested.

* *Items marked thus give the names of parties awarded contracts.*

Roanoke, Va.—The Roanoke St. Ry. & Elec. Co., it is said, will build an extensive line in the southwestern part of the city.

Kennewick, Wash.—The Priest Rapids Ry. Co. is stated to have filed papers of incorporation with the Secretary of State at Olympia, declaring its purpose to build an electric railway from Kennewick to Wenatchee. Capital, $1,000,000. W. R. Rust, Pres.; M. B. Haines, Vice-Pres. and Treas.; E. H. Guie, of Seattle, Secy. The principal office of the company will be at Seattle. The route of the new road is down the Columbia River Valley almost on a straight line from Wenatchee to Kennewick. The distance is more than 100 miles.

Madison, Wis.—Daniel B. Ely, of New York, N. Y., is reported to be interested in the proposed electric railway to connect Madison and Jamesville, Wis., 36 miles, running through Macfarland, Stoughton and Edgerton. The line will be of entirely new construction, and right of way, which is mostly all obtained, will be private. No contracts have been let as yet.

RAILROADS.

Notes Arranged Alphabetically by States.

East St. Louis, Ill.—A charter has been granted to the East St. Louis & Eastern Ry. Co., with principal office in East St. Louis, and a capital of $2,500, to construct a line from a point near Belleville to a point in the county of St. Clair, Ill. Incorporators: L. G. Haynes, T. W. Gregory, G. C. Pierce and others.

**Indianapolis, Ind.*—The Bd. of Pub. Wks. has awarded contract for track elevation at Massachusetts and Valley Aves. and Hazel St. to the American Constr. Co. for $11,650.

Catasauqua, Pa.—A charter has been granted to the Crane R. R. Co. to construct a line from Whitehall Township, Lehigh County, at a point on the Lehigh Valley R. R. to Catasauqua, 3 miles; capital $30,000. Leonard Pickett, Pres., Catasauqua.

Philadelphia, Pa.—The Board of City Surveyors has passed favorably upon plans for the abolition of grade crossing along the line of the Philadelphia and Trenton Branch of the Pennsylvania R. R. The plans include the steel and masonry construction work between Venango and Cambria Sts. The bridges along the route will be of steel and masonry.

Ft. Worth, Tex.—The Missouri, Kansas & Texas R. R. Co. (S. B. Fisher, Ch. Engr., St. Louis, Mo.), is reported to have adopted plans for extensive terminal improvements in Texas. In Ft. Worth and Dallas about $600,000 will be expended.

Superior, Wis.—The Soo R. R. Co. (Thos. Greene, Ch. Engr., Minneapolis, Minn.) is reported to have filed an amendment to its articles of incorporation in the State Secretary's office, declaring its intention to build a branch line from Brooten, Minn., to Superior; 15 miles of line will be in Wisconsin, all in Douglas County.

PUBLIC BUILDINGS.

Notes Arranged Alphabetically by States.

Selma, Ala.—Bids will be received by Jas. Knox Taylor, Superv. Archt., Treasury Dept., Washington, D. C., until Sept. 30 for the construction (including plumbing, gas piping heating apparatus, electric conduits and wiring) of the U. S. Post Office at Selma.

**Visalia, Cal.*—The Bd. of Superv., it is reported, has awarded W. D. Trewhitt of Hanford the contract to construct the additions to the court house, and to install an elevator and modern heating system at $40,000.

New London, Conn.—Bids will be received until Sept. 4 by Col. F. L. Denny, Quartermaster Marine Corps, Washington, D. C., for repairs and improvements to buildings belonging to the Marine Corps, Naval Station, New London. Jas. Sweeney, Archt., 80 State St., New London.

**Farnhurst, Del.*—C. E. Anderson, of Wilmington, it is stated, has been awarded the contract for the erection of a building for the insane at Farnhurst at $34,470 (bids received Aug. 17). Other bids received were A. S. Reed & Brother Co., $36,993; William D. Haddock, $35,825; J. A. Hirons, Dover, $34,980; Lynch & Bro., Philadelphia, $34,198.

Atlanta, Ga.—P. Thornton Marye, Equitable Bldg., it is stated, has recommended to the County Comrs. that a 6-story building costing about $881,303 be erected for the city hall and court house building.

Savannah, Ga.—The following are the bids recently opened at the office of the Superv. Archt., Treas. Dept., Washington, D. C., for heating apparatus, for U. S. Custom House at Savannah: Newport News Htg. & Plumbing Co., Newport News, Va., $3,840; Robinson Bros., Pine Bluff, Ark., $4,452; and Atlanta Steam Htg. Co., Atlanta, $3,645.

Forsyth, Ga.—Bids will be received until Sept. 10 by the Bd. Comrs. and Revenues (J. S. Jossey, Chmn.) for heating the court house.

Great Lakes, North Chicago, Ill.—The following are the bids opened on Aug. 15 at the office of the Bureau of Navigation, Navy Dept., Washington, D. C., for buildings at the naval training station as follows: *(a)* storehouse, *(b)* bathhouse, *(c)* brig, *(d)* stable, *(e)* receiving bldgs., *(f)* galley and laundry; *(g)* 6 dormitories. Northern Constr. Co., Milwaukee, Wis., *a* $70,000, *b* $60,000, *c* $24,300, *d* $23,830, *e* $28,640, *f* $26,000, *g* $139,400, or all for $370,000; Noel Constr. Co., Baltimore, Md., *a* $72,428, *b* $61,062, *c* $25,227, *d* $23,821, *e* $45,706, *f* $24,611, *g* $114,055, or all for $392,000; McArthur Bros., Chicago, Ill., all for $97,475.

Chicago, Ill.—The city has had plans prepared for 2 new police stations with municipal court rooms. One will be erected at 40th Ave. and Fillmore St. It will be 3 stories, 60x120 ft. and cost $50,000, and the other a 3 story building, 57x167 ft., to be built at N. California and Shakespeare Aves., and cost $60,000. Plans for the buildings have been prepared by City Archt. Chas. F. Hermann, City Hall.

Edwardsville, Ill.—The plans of J. W. Kennedy, of East St. Louis, it is stated, have been accepted for the addition to the Madison County Hospital; cost, $13,[illegible]

Rockport, Ind.—It is stated that the court house is to be remodeled at a cost of $40,000. Frank J. Schlotter, Evansville, is the archt.

Ligonier, Ind.—It is reported that the Library Bd. (Mrs. Jacob Streets, Chmn.) will receive bids until Sept. 2 for erecting a library.

New Castle, Ind.—Bids will be received until Sept. 5 by the Bd. Trus., Indiana Village for Epileptics (Enoch G. Hogate, Secy.) for erecting 2 cottages. W. S. Kaufman & Son, Archts., Richmond.

Muscatine, Ia.—Bids will be received until Sept. 26 by the Bd. Co. Superv. (W. H. Fishburn, Chmn.) for furnishing material and erecting complete (excepting furnishing) a fireproof court house. Jos. E. Mills, Archt., 510 Washington Arcade, Detroit, Mich.; A. S. Lawrence, Co. Aud.

Des Moines, Ia.—The Iowa Sanitarium Co., in which Dr. Habernicht is interested, intends, according to reports, to erect a sanitarium on W. Grand Ave., to cost $50,000.

Mason City, Ia.—The following are the bids opened on Aug. 12 at the office of the Superv. Archt., Treas. Dept., Washington, D. C., for the construction (including plumbing, gas piping, heating apparatus, electric conduits and wiring) of U. S. Post Office at Mason City: I. W. Miller, St. Paul, Minn., $73,237; Hennessy Constr. Co., St. Paul, Minn., $74,272; Gen'l Constr. Co., Milwaukee, Wis., $68,298; Northern Constr. Co., Milwaukee, Wis., $66,000; G. B. Strickler, Washington, D. C., $75,445; J. H. Weise, Omaha, Neb., $69,246, and Bartlett & Kling, Cedar Rapids, $75,635.

Columbus Grove, O.—It is stated that bids will be received until Sept. 2 by L. E. Lee, Clk. Bd. Educ., Sugar Creek Township, for erecting a 2-story brick and stone school.

Cleveland, O.—Bids will be received until Sept. 9 by the Clk. Bd. Educ. for completing an annex to the Harvard school. Chas. Orr, Dir. Schools.

Kane, Pa.—J. E. Henretta, Secy. Special School Bldg. Com., writes that on Sept. 4 an architect will be selected to prepare plans for a high schood, to cost about $90,000.

Lancaster, Pa.—Bids will be received until Aug. 28 by the Property Com. City School Bd. (W. H. Roland, Chmn., 20 S. Duke St.) for furnishing material and installing a low pressure steam-heating and ventilating apparatus in the S. Duke and S. Mulberry Sts. Schools; also erecting outside toilet annexes and certain interior alterations to the above schools.

**Glenside, Pa.*—It is stated that Cheltenham Township's Bd. of School Directors has awarded the contract for erecting a public school at Glenside to Michael E. Hauser, of Glenside, for $20,494.

Lead, S. D.—Carrie M. Voigt, Clk. Bd. of Educ., writes that all bids opened on Aug. 1 for furnishing and installing complete blast steam heating and ventilating plants, with central boiler plant, for the high school and assembly hall buildings, have been rejected, and the matter of procuring new bids has been postponed until the spring of 1908.

Morristown, Tenn.—It is stated that a $20,000 school is to be erected at the Morristown Normal and Industrial College.

College Station, Tex.—Chas. Puryeau, Dean of Agricultural and Mechanical College, writes that no plans were accepted on Aug. 3 for the proposed buildings to be erected at College Station and Prairie View. For further information address the president, H. H. Harrington, at College Station.

**Brenhom, Tex.*—The contract to erect the $30,000 school is reported awarded to F. W. Wood.

Tomahawk, Wis.—Henry Wildhagen, of Ashland, it is reported, has submitted plans for a 2-story high school to cost $40,000.

Beloit, Wis.—Bids will be received until Sept. 3 by Dr. E. C. Helm, Secy. Bd. Educ., for erecting a high school. J. C. Llewllyn, 1516 First Natl. Bank Bldg., Chicago, Ill.

Olympia, Wash.—The following are reported to be the bids opened Aug. 10 by the State Bd. of Control at Olympia for new buildings for the State College at Pullman and for the normal schools at Cheney and Ellensburg and for plumbing work for the Ft. Steilacoom asylum:

Remodeling plumbing at Ft. Steilacoom hospital (all bidders of Tacoma): W. B. Coffee Plumbing Co., $7,231; T. H. Bellingham, $8,107; A. M. Goddard, $7,850; Ben Olson Co., $8,499.

Training school at normal school, Cheney; total appropriation for building, including plumbing, $65,000; For building alone: Hastie & Dougan, Seattle, $80,040; John T. Huetter, Spokane, $86,715; M. C. Murphy, Spokane, $86,000; Lance & Peters, Seattle, $80,000; A. E. White, Seattle, $79,842. For plumbing: W. B. Coffee Plumbing Co., Tacoma, $4,504; Jas. Smythe Plumbing Co., Spokane, $4,950. Heating system Cheney normal, appropriation $10,000: Jas. Smythe Plumbing Co., Spokane, $13,950; Inland Heating & Ventilating Co., Spokane, $12,900.

Ellensburg normal school, training school building, including plumbing and equipment, total appropriation $65,000. Building alone: A. E. White, Seattle, $75,400; Lance & Peters, Seattle, $72,850; Jones & Woodman, Seattle, $80,400; M. C. Murphy, Spokane, $78,887; John T. Huetter, Spokane, $81,201; Hastie & Dougan, Seattle, $73,644. Plumbing: W. B. Coffee Plumbing Co., Tacoma, $4,283; Jas. Smythe Plumbing Co., Spokane, $4,750. Heating system, Ellensburg normal, total appropriation, $10,000: Seattle Heating & Plumbing So., $17,200; Rautman Plumbing & Heating Co., Seattle, $18,850.

Recitation building and equipment, Pullman, total appropriation $125,000; building, except heating: Hastie & Dougan, Seattle, $110,947; D. C. Murphy, Spokane, $113,063; Lance & Peters, Seattle, $116,900. Heating, Arnold-Evans Co., Spokane, $7,870; G. H. Sutherland Co., Walla Walla, $7,560.

NEW INDUSTRIAL PLANTS.

See also "Business Buildings."

Gadsden, Ala.—Plans are reported completed for the axle forging plant to be built at the plant of the Southern Steel Co. in Gadsden. Plans are said to be in the hands of Gen. Supt. Nicholls at Alabama City. It is also reported that an annex is to be constructed to the plant for rolls to make smaller billets.

Tucson, Ariz.—Henry Till is said to be contemplating the erection of a brewery here to cost about $50,000.

Los Angeles, Cal.—The Duquesne Brewing Co. is reported incorporated with a capital of $500,000 and has secured a site on Albion and E. Main Sts., on which it is proposed erecting a brewery estimated to cost $250,000; capacity, 50,000 bbls. A. K. Martell, Mgr.; Ralph Moss, Secy.

San Francisco, Cal.—The Pacific Steel Corporation in which Jas. A. Moore, of Seattle, Wash., is interested, it is stated, proposes establishing a plant on San Francisco Bay to cost about $30,000,000 for the manufacture of structural steel, pig iron and bar iron.

Denver, Colo.—It is stated that Schwarzschild & Sulzberger (G. F. Sulzberger, Vice.-Pres. and Gen. Mgr.) propose erecting a packing plant here.

**Parkville, Conn.*—B. H. Hibbard Co., of New Britain, is reported to have secured the contract to erect at Parkville for the Royal Typewriter Co., of Brooklyn, N. Y., 2 4-story brick buildings, each 300x50 ft., and some smaller buildings at one end of the larger structure. The company plans to erect a $350,000 plant eventually, but only part of it is to be built at present.

Washington, D. C.—Bids will be received until Sept. 16 by Maj. Spencer Cosby, Corps. Engrs., U. S. A., Washington, for constructing a machine shop building at the Washington Filtration Plant.

Chicago, Ill.—Plans have been completed for a paint factory and warehouse to be erected at 90 to 106 Seward St. for the Health & Milligan Mfg. Co. The buildings will be from one to 3 stories in height and will cost $250,000.

It is stated that the Saml. Cupples Woodenware Co. has secured a lease of the site at St. Clair and Illinois Sts. and intends erecting a factory.

Wm. Seufferle, who conducts a cooperage plant at Livingston and Linn Sts., according to reports, contemplates enlarging the plant.

Michigan City, Ind.—Bids are wanted by B. Kronthal & Co., Michigan City, for erecting a 2-story brick factory. Bid on plumbing and heating to be submitted separately.

New Albany, Ind.—The New Albany Veneering Co. is reported to have filed articles of incorporation with a capital of $100,000. Incorporators: Chas. W. Inman, E. Vernon Knight and others. The company has a site on E. 14th and Water Sts., on which it is proposed erecting a plant to employ 100 operators.

Muncie, Ind.—H. P. Gamble, Jay Winchester and Chas. McClintock, it is stated, intend erecting a plant here to manufacture oil engines.

Cumberland, Md.—It is reported that the plant of the Cumberland Steel Co. has been destroyed by fire. The loss is estimated at $350,000. The plant produced accurate steel castings. The buildings occupied covered an area of 350x1,200 ft.

**West Albany, N. Y.*—We are informed that the contract for general construction of boiler shop at West Albany, for the N. Y. Central & Hudson River R. R. Co. (Bids opened July 25) has been awarded to R. Richards & Son, of Utica. Louis F. Shoemaker & Co., of New York City, are reported to have secured the contract for the steel framework.

**Philadelphia, Pa.*—The William Steele & Sons Co., 1600 Arch St., it is stated, have secured the contract to erect a $250,000 bread baking plant for the Freihofer Vienna Bread Baking Co., on 19th, 20th and Clearfield Sts. and Indiana Ave. The buildings will be constructed of reinforced concrete, brick and terra cotta, and will be fireproof throughout. There will be a one-story bread-baking building, 360x142 ft.; a 1-story "home" bakery, 189x104 ft.; a 3-story shipping building, 360x92 ft., and a 1-story power plant, 70x102 ft. Besides these a cold storage plant, 153x54 ft., will also be constructed.

*It is stated that Cramp & Co., Commonwealth Bldg., have the contract to erect a 3-story and basement manufacturing building at 6th St. and Columbia Ave. for the Henry Sheip Manufacturing Co. The building will be 96x121 ft. and of fireproof construction. The walls will be of brick and the columns, floors and roof of reinforced concrete. There will be a 30,000 gal. sprinkler tank erected on the roof and a 3,000-gal. house supply tank. A freight elevator also will be installed. The building will cost about $75,000.

*Smith, Hardican Co., Perry Bldg., it is stated, has been awarded the contract for erecting a 4-story and basement store and manufacturing building for the Stewart Electrical Co., on Filbert St., east of 7th St. It will be 54x27 ft., and fireproof throughout. The materials will be concrete, brick and stone. Provisions will be made for the erection of two additional stories later. Edwin F. Bertolett, West End Trust Bldg., is the archt.

Beaumont, Tex.—It is reported that the Kirby Lumber Co. will erect a saw mill near Beaumont to have a capacity of from 70,000 to 200,000 ft. per day. To be equipped with double band saw, and a gang saw will likely be added. It will be fitted with electric lights, a large dry kiln and possibly a planer will be erected in the vicinity.

Norfolk, Va.—Edw. S. Cramp, of Philadelphia, Pa., associated with George W. Norris, of the banking firm of Edward L. Smith & Co., of Philadelphia, Pa., it is reported, has secured 1,000 ft. frontage on the main harbor in this city, and will immediately begin the construction of a large shipbuilding plant. In addition to doing all kinds of repair work, the plant, which will have a working capital of $500,000, will be constructed so as to be in a position to make bids for the construction of the largest type of battleship. Edw. S. Cramp, it is stated, will be Pres. of the concern.

Milwaukee, Wis.—The Milwaukee Electric Ry. & Light Co. (C. J. Davidson, Ch. Engr., Milwaukee) is said to be securing land on which it is proposed erecting new car shops.

* *Items marked thus give the names of parties awarded contracts.*

STREET CLEANING AND GARBAGE DISPOSAL.

Ft. Benj. Harrison, Ind.—Bids will be received until Sept. 13 by Geo. H. Penrose, Quarter Master, U. S. A., for a garbage crematory at this post, as advertised in The Engineering Record.

MISCELLANEOUS.

Notes Arranged Alphabetically by States

San Francisco, Cal.—The Bd. of Harbor Comrs. is reported to have received an offer from the Western Pacific Ry. Co. (H. P. McCartney, Asst. Engr., San Francisco) to construct a ferry slip and landing pier north of Islais Creek, on condition that the State will build a sea wall for that purpose and also keep the dock in repair; cost of sea wall is estimated at about $130,000.

1,000 tons stone ballast	2.50	2.00	2.00
Totals	$465,600	$431,420	$393,800

Reading, Pa.—Bids will soon be called for by City Council for the construction of the Spring St. subway, to be entirely of concrete, and cost about $200,000.

San Juan, P. R.—The following are the bids opened on Aug. 7 by Maj. Chas. L. Potter, Corps Engrs., U. S. A., at Tompkinsville, S. I., N. Y., for dredging San Juan harbor, Porto Rico: (*a*) 1,880,000 cu. yds. soft dredging; (*b*) 65,700 cu. yds. coral rock; (*c*) totals: Utrecht contr. Co., Brooklyn, N. Y., *a* 11 cts., *b* 69 cts., *c* $252,133; Standard Dredging Co., Wilmington, Del., *a* 19 cts., *b* $6.80, *c* $803,960; Michael J. Dady, Brooklyn, N. Y., *a* 43 cts., *b* $9.85, *c* $1,455,545.

Ft. Moultrie, S. C.—Bids will be received until Sept. 14 by J. M. Fulton, Q. M., U. S. A., for dredging and fitting at this post.

Galveston, Tex.—Gen. H. M. Roberts, late of U. S. Engrs., is stated to have completed the report for the construction of the Galveston causeway, and the same has been presented by the County Comrs. to the three railroads having terminals here. The report recommends that a structure be built to cost $1,500,000, of which $710,000 will be used for the bridge, including the draw, and $440,000 for the causeway. The railroads will be asked to pay half the cost.

Peterboro, Ont.—Bids will be received until Oct. 10 by Alex. J. Grant, Supt. Engr., Trent Canal, Peterboro, for the works connected with the construction of Sec. 1, Ontario-Rice Lake Div. of the canal.

AMERICAN PUBLIC HEALTH ASSOCIATION. Secretary, Dr. C. O. Probst, Columbus, O. Annual meeting, Atlantic City, Sept. 30-Oct. 4, 1907.

THE ASHOKAN DAM CONTRACT.

On Monday of this week the Board of Water Supply of New York awarded the contract for the Ashokan dams in the Catskills to MacArthur Brothers Co. & Winston & Co. for $12,669,775. This was not the lowest bid, as the John Peirce Co. submitted a tender of $10,315,350. In announcing the award Commissioner Chadwick made the following formal statement:

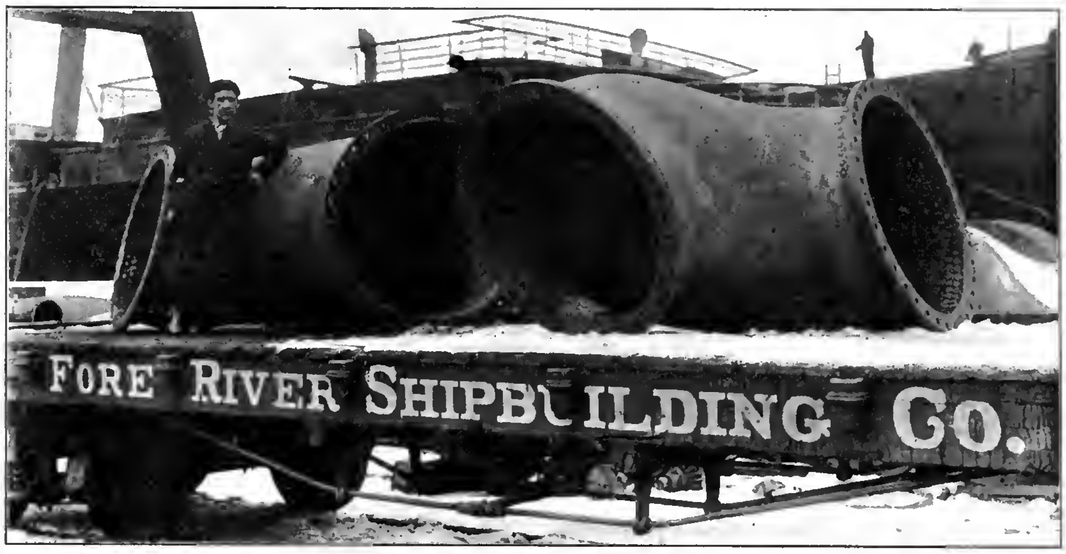
"The question regards the construction of a dam which shall hold water, which involves a special form of construction, requiring expert knowledge and experience, and the details of which must be rigidly insisted upon.

"The cost of the work, as separately and independently estimated by the chief engineer, two designing engineers and an assistant engineer, is shown to be over $2,000,000 more than the bid of the lowest bidder. These estimates of the engineering department are confirmed by the bids of four of the five bidders, each one of whom has had more or less experience in this particular kind of work. In an analysis of the bid of the lowest bidder his figures on masonry work, with which he is familiar, are approximately correct, according to the best evidence obtainable, but in the items of excavation and embankment his figures are over $2,000,000 less than the next lowest bidder.

"In regard to their bid, Mr. Peirce, of the John Peirce Company, the lowest bidder, states that in the matter of excavation and embankment for reservoir construction, his company has had no experience; that they were dependent upon others for their figures; that upon investigation he can procure no figures on these items to protect their proposal, and that upon rechecking his figures he finds that the estimate is too low to do satisfactory work for himself or the city. Therefore, the estimate of the engineering department and four bidders out of five is practically confirmed by the statement of Mr. Peirce himself, and there is no other conclusion to be reached, in the light of this evidence, than that the bid of the lowest bidder is much below the necessary cost, besides being concededly based upon lack of knowledge and experience as to excavation and embankment items.

"To best secure the efficient performance of this work it is necessary that the Board of Water Supply should take into consideration every phase of the question, the elements of which are financial standing, knowledge, experience and such a margin for profit as will secure willingness and ability to continue the work to its conclusion with essential speed, the absence of any one or more of these elements being vital. Therefore, in the case of the lowest bidder the absence of the elements of knowledge and experience in the matters of excavation and embankment for reservoir construction, and the evidence showing lack of margin for legitimate profit, is deemed sufficient, in the interests of the city, to recommend the rejection of that bid.

"Your committee, therefore, recommends, in view of the report of the chief engineer and the reasons set forth therein, and the answers to questions submitted to each one of the three consulting engineers, Messrs. Freeman, Burr and Stearns, which are herewith submitted, and which concur, supported by such additional thought and judgment as it itself has been able to bring to bear upon this subject, that contract No. 3, for the construction of the Ashokan dam, be awarded to MacArthur Brothers Company and Winston & Co., at their bid, which on the assumed basis of quantities amounts to $12,669,775, the committee having satisfied itself as to the financial standing, knowledge, experience and ability of said company to do the work."



HEAVY COPPER PIPES FOR STEAMSHIP "CREOLE."

HEAVY COPPER PIPES.

As an example of copper pipe work, the accompanying illustration is particularly interesting, for the pipes shown are of very unusual weight and sizes. The two copper pipes seen in the photograph are the main exhaust pipes of the Curtis turbine steamship "Creole" and were made at the copper shop of the Fore River Shipbuilding Co., at Quincy, Mass., the builders of the vessel. Each of these pipes weighs 2,500 lb. Each pipe is 42 in. in diameter, inside measurement, and 5/6 in. in thickness. Each pipe was made from sheet copper in four pieces, and the skill used in brazing these pieces together is shown in the smoothness and shapliness of the pipes, the workmanship on which will appeal to coppersmiths, who will appreciate that the pipe is nearly, if not quite, the largest size copper pipe made in this country for marine purposes. The Fore River company makes all kinds of copper work and steel piping of any shape or size up to 300 lb. pressure for power plants, distilleries, breweries, and the like, and with contracts ahead including the building of one of the two great 20,000-ton battleships for the U. S. Navy, to keep the works busy for three years, will extend this branch of its business and give employment to an additional number of coppersmiths.

THE DIRECT-ACTING SOLAR ENGINE.

A great many attempts have been made to utilize solar energy by directing the sun's rays on a boiler, furnishing steam for an ordinary engine. Capt. John Ericson was one of the famous inventors who was convinced that a practically useful apparatus for the purpose could be made. All of these suggestions have called for some combination of mirrors to concentrate the sun's rays, and all have proved impracticable commercially because of their enormous first cost per horse-power, the impossibility of building large units, the rapid deterioration of the parts, and the necessity of highly skilled attedance. The problem has been attacked by Mr. Frank Shuman, of 3,400 Disston street, Tacony, Philadelphia, from an entirely new quarter, with results which he considers extremely promising and are now receiving careful attention in many quarters. Mr. Schuman's success as an inventor of machinery for making wire-glass, mercerizing cotton and washing wool is well known and his Simplex concrete pile is extensively employed in engineering construction. He does not claim to have invented an apparatus that can be set up in a London cellar and furnish power to light the city, but asserts that he has devised a method of utilizing the heat of hot districts having abundant sunlight in such a way that power developed there may be botfled up in the shape of liquid air for use anywhere.

The novel apparatus he employs is merely a glorified hotbed, such as farmers use in forcing small fruits and vegetables. This he calls a hot box and one at his Tacony property measures about 18x60 ft. It gives temperatures as high as 240° F. under favorable conditions, while it is believed that 300° and over can be easily reached in the tropics. It consists of a flat box of the necessary size in which the steam pipes are laid, and above these pipes are two layers of window glass with an air space of about one inch between them. The rays of the sun pass, without obstruction through the glass to the blackened iron pipes, and are converted into ordinary heat, which is retained by the two layers of glass and the air between them. This heat is absorbed in the liquid contained in the pipes and generates pressure which drives the engine. The exhaust is condensed to the fluid state and returned to the boiler, thus constituting an endless cycle. In this latitude ether is used in the tubes. In the tropics ordinary water is intended to be used entirely.

The first cost of construction is no more than that of a good modern steam plant of the same power, according to Mr. Shuman's figures. It can be made of any size, being capable of indefinite expansion. The wear and tear is estimated at only about one-tenth of that of an ordinary steam-power plant. Any ordinary steam engineer can run it and the cost of attendance is believed to be only about one-tenth of that of a modern steam plant. The cost of the fuel, of course, is absolutely nothing.

For pumping water for irrigation purposes the solar engine is considered eminently fitted. It will pump as long as the sun shines, and whatever water it pumps is free, except the lubrication, the interest on the investment,

and the extremely slight attendance. One man on horseback could attend 50 small pumping stations, and this is considered the ideal use of the solar engine at the start. By means of artesian wells and solar engines, irrigation will cost very little indeed.

Mr. Shuman believes, however, that solar engines will ultimately furnish indirectly much of the mechanical power of the world. By means of great solar-power stations located in the tropics, he figures that enormous quantities of liquefied air can be produced at a price even below $1 per ton. This liquefied air can be used for running any continuous expansion motor, such as the steam engine, he states, and refers to recent experience in Great Britain and Boston in proof of this.

A triple effect from liquefied air can always be secured. The solar engine first manufactures liquefied air; this liquefied air is put into boilers furnished with a column-still attachment. The first run of this boiler would be nitrogen. This is diverted into gasometers after it has passed through the engine and given off its mechanical power, and after it has passed through brine tanks and given off its great cold to the artificial ice, and from this nitrogen calcium cyanamide, an artificial fertilizer, can be made.

The rapid development of liquefied air is a happy coincidence. The solar engine, without the liquefied air, can be used only for pumping water, owing to its intermittent power. The solar-power plant on exhibition at Tacony is the first one. There have been mistakes made in it which can be obviated in the second one. Whatever results it gives are believed to be only a small fraction of what it will give after these changes have been made. As the size of the solar-heat absorber is increased the power generated grows in greater proportion. It was never contemplated to use the solar engine in Philadelphia. The percentage of sunlight is too low, and the humidity too great. This season, particularly, has been an exceptionally bad one for any sun engine in this locality.

The home of the solar-engine, Mr. Shuman states, will be dry, intensely hot countries like Arizona and Egypt, and he estimates that from every eight square yards of exposed surface, one horsepower can be generated in these localities.

PROGRESS ON THE PANAMA CANAL.

The Isthmian Canal Commission has given out the following statement regarding the condition of construction work on the Panama Canal:

With the present organization and the progress which now is made, the canal can be completed more rapidly than by restraining expenditure within the appropriations, which were made at the last session of Congress to continue the work until 1908. The work on the locks and dams on each terminus has been opened and will be pushed vigorously during the year, while very little was expended at those places during the fiscal year which terminated June 30, 1907.

The time of completion of the canal appears to depend now upon work at Gatun, rather than the work of excavation, which has hitherto been generally taken as the determining feature. The progress in this direction has been faster than anticipated, and the appropriation made at the last session of Congress would not be sufficient to supply the necessary plant to begin laying the concrete in the locks and dams during the next fiscal year, although progress already made indicates that such a beginning is advisable.

In order to avoid reducing the force to keep within the expenditure already authorized for this fiscal year, the chairman of the commission has recommended to the Secretary of War that the work be allowed to proceed and that Congress be appealed to at its next session to make good any deficiency in the funds now available. If the funds requested are not provided, it will, of course, be necessary to reduce the rate of expenditure to keep within the appropriations on hand. About $8,000,000 in excess of the appropriations already made could be used to advantage in pushing forward the work during the present year.

RECLAMATION OF THE JERSEY MEADOWS

Dredging operations recently have been begun under the direction of the United States War Department, which, when completed, will afford a waterway through which vessels of deep draft can reach Newark, N. J., by way of the Kill von Kull, Newark Bay, and the Passaic River. The present channel, eleven miles long from the Kill von Kull to the Greenwood Lake bridge of the Erie R. R. in Newark, is to be increased in depth from 12 to 16 ft. at low tide and is to be given an average width of 300 ft. Approximately 4,000,000 cubic yards of excavation will be necessary. The spoil will be delivered by the dredges to scows, from which it will in turn be delivered to suction dredges and pumped in pipe lines onto the adjacent meadows in connection with their reclamation.

The channel work of the Government is supplemented by the city, which has entered into a $10,000 contract for dredging about the docks and wharves near the new channel. The original depth of water along these docks was 8 ft., but deposits discharged from the city sewers have reduced the depth to less than 6 ft. The original depth is to be restored by the city, but if advantage is to be taken by the dock owners of the full depth of the new channel, the docks will have to be reconstructed.

The project for the reclamation of about 4,000 acres of the Newark, Hackensack and Elizabeth meadows has been taken up by the United States Department of Agriculture, and a preliminary survey party is now in the field.

The work of the War Department is under the general direction of Col. Daniel W. Lockwood, Corps of Engineers, U. S. A. Mr. M. R. Sherrod, chief engineer of the engineering department of Newark, is directing the work of the city in connection with both the channel and reclamation projects, and Mr. Joseph O. Wright, of the drainage division of the Department of Agriculture, is in charge of the reclamation survey. The contractor for the channel dredging is the Midland Land & Improvement Co., and the P. Sanford Ross Co. is the contractor for the city's work.

THE DALLETT HOSE COUPLING.

The rapidly increasing use of compressed air in various industries has led to the design of various special fittings, particularly hose couplings, for use in connection with pneumatic tools. The accompanying illustration shows the general features of such a coupling which the Thomas H. Dallett Co., of Philadelphia, has placed on the market after four years of experimenting and testing. The illustration shows the two halves of the coupling, which are made of hard bronze, and also the gasket. The latter is of a rubber composition not affected by oil or gasoline, and is held in the female half of the coupling by the flange around the larger end fitting into a recess. When the coupling is connected, the tapering end of the gasket enters the conical opening in the male part, in which it fits loosely. When pressure comes on the coupling, this tapered end of the gasket is ex-

DALLETT HOSE COUPLING.

panded against the wall of the conical opening, and as soon as the pressure is relieved the gasket becomes loose again.

As will be noted, the male part of the coupling is provided with four locking-lugs, equally spaced around its circumference, and when the male and female parts are snapped together, these lugs insure their being held squarely, which obviates any tendency to leak.

To connect the coupling, simply press the parts together, give one-eighth of a turn and the locking-ring will spring into place. It is then a physical impossibility for it to be pulled apart or accidentally disconnected. When the connecton is to be broken, press back the locking-ring and give the coupling one-eighth turn. The locking-ring is provided with a milled ridge around its circumference which affords a good grip for pressing it back when disconnecting the coupling and so stiffens and strengthens it that it requires great abuse to bend it so as to impair the working of the coupling.

PROPOSED FINE FOR POLLUTION OF NEW YORK HARBOR.

A petition alleging that New York city owes the State over $44,000,000 in penalties for wholesale violations of the sewer laws of 1903, and asking that the Attorney General ascertain to what extent the city is liable, was presented to Governor Hughes of New York at Albany recently by Edward Hatch, Jr., chairman of the Special Committee on Pollution of the Merchants' Association. The petition is based on Section 75, Chapter 468, of the laws of 1903, which reads in part:

"No . . . municipality, shall . . . discharge or cause to be discharged into any of the waters of this State, unless the same shall have been permitted by the State Commissioner of Health, any sewage . . . or any substance, containing the same in quantities injurious to the public health, . . . unless express permission to do so shall have been first given in writing by the State Commissioner of Health, as provided in this article, except as hereinafter provided."

In Section 79-d the penalty for failure to obtain such permit to discharge sewage from any public sewer system of the State is $500, with a further penalty of $50 for each day the offense is maintained. The penalty for failure to make a report in the case of sewers existing at the time of the act is $50.

The petition makes the following charge:

"According to the information furnished by the authorities having charge of the sewer systems in the different boroughs there are some 624 sewers which have been 'constructed, modified or extended' since the passage of this act, and all, it so appears, in direct violation of the provisions of the Public Health law. This law is applicable to the city of Greater New York, if there is any validity in the law.

"According to one interpretation of the law, which does not seem to be an unreasonable one, the city of Greater New York would appear to be liable for penalties and fines for the violation of said law, to the amount of $44,186,735, divided among the boroughs as follows: Manhattan, $15,156,100; Brooklyn, $16,099,510; Queens, $4,546,850; Bronx, $7,771,875; Richmond, $612,400."

In speaking of the petition, Mr. Hatch said:

"The possible enormity of the fine may stagger the taxpayers of Greater New York, but there should be no question about the collection of the penalty. An offense against the health law by a corporation or municipality should be dealth with quite as severely as an offense by an individual, and with Governor Hughes' distinguished ability to apprehend the violators of the law, as he did in the insurance cases, the polluters of our rivers and harbor may find themselves confronted by a serious proposition. That there are methods for the disposal of sewage and wastes is well established, and many of the more advanced centers of population of the old world have abandoned the unsanitary practice of using the streams and lakes as common scavengers and adopted some method of purification treatment."

CHANGED METHODS OF MEETING EXPENSE OF NEW YORK STATE HIGHWAYS.

The members of the Boards of Supervisors in New York State have recently received a letter from State Engineer Skene explaining the new system of assessing the cost of State highway work. The most important part of the letter is as follows:

Heretofore the cost of improved highways has been divided as follows: State, 50 per cent.; county, 35 per cent. and town, 15 per cent. Under the new amendment the proportion to be borne by the county will be 2 per cent. of the cost of the improvement for each $1,000 of assessed valuation per mile of highways within the county, while the proportion to be borne by the town will be 1 per cent. of the cost of the improvement for each $1,000 of assessed valuation per mile of highway within the town.

The assessed valuation per mile is to be determined by dividing the total assessed valuation of the county or town, equalized for State purposes, by the total number of miles of highways in said county or town, respectively, exclusive of cities and incorporated villages. In no case, however, shall the county pay more than 35 per cent., or the town more than 15 per cent. of the cost of the improvement.

Assuming that the road to be improved will cost $40,000 and that the equalized assessed valuation of the county is $11,000,000 and the total miles of highways within the county is 1,000, the assessed valuation per mile is therefore $11,000, and 2 per cent. for each $1,000 of the $11,000 makes 22 per cent. Twenty-two per cent. of the $40,000 is $8,800 or the county's share.

Assuming that the assessed valuation of the town is $400,000 and the total number of miles in the town is 80, the assessed valuation per mile is therefore $5,000, and 1 per cent. for each $1,000 of the $5,000 makes 5 per cent. Five per cent. of the $40,000 is $2,000 or the town's share.

The State's share is the remainder, $29,200. Under the former law the State would have paid 50 per cent., or $20,000; the county, 35 per cent., or $14,000, and the town, 15 per cent., or $6,000.

PERSONAL NOTES.

Messrs. Burns & McDonnell, consulting engineers, Kansas City, Mo., have removed their offices to 821-23 Scarritt Building.

Messrs. Walter H. Graves, Fred S. Sawyer and George L. Sawyer have formed the Northwestern Engineering Co., with headquarters at Seattle, Wash.

William H. Denyse, formerly city engineer of Long Branch, N. J., and for many years in private practice there as a civil engineer, died, Aug. 21, aged 52 years.

Thomas Cornish, a mining engineer well known in the West, and formerly manager of W. S. Stratton's "Independence" mine, died suddenly in the Nevada Death Valley recently.

Mr. John W. Alvord, of Chicago, has been retained as consulting engineer to investigate and report on the desirability and cost of obtaining a supply of water from Lake Michigan for Grand Rapids, Mich.

Mr. R. V. Engstrom has resigned as superintendent for the Brayton Engineering Co., St. Paul, Minn., to become an instructor in the department of theoretical and applied mechanics at the University of Illinois.

Mr. P. P. Bird, formerly steam engineer of the South Chicago works of the Illinois Steel Co., has been appointed smoke inspector for the city of Chicago under the new ordinance which becomes effective Sept. 1.

Sir John Jackson, the well-known British contractor, has established a fund, yielding about $1,000 annually, at Edinburgh University. It is in honor of the late P. G. Tait, equally eminent as physicist and golfer, and will be used in physical research.

Mr. Ralph Mackenzie, of Negaunee, Mich., has been appointed chief engineer of the Government's coal min-

ing operations in the Philippine Islands. A considerable area is to be explored, and it is expected that several mines will be developed. The principal coaling station will be on Batan Island.

Dr. Marshman Edward Wadsworth, head of the School of Mines at the Pennsylvania State College, has resigned to become dean of the School of Mines of the Western University of Pennsylvania, and professor of geology and metallurgy. Dr. Wadsworth was State Geologist of Michigan from 1888 to 1893, and has been State Geologist of the Pennsylvania Board of Agriculture since 1902.

The Bureaus of Highways and of Street Cleaning of Philadelphia have been consolidated by Mayor Reyburn, and Mr. William R. Benson, assistant director of public works, has been appointed as chief of the new bureau. Mr. William R. Knight, Jr., has been appointed to succeed Mr. Benson as assistant director of public works.

Dr. Elwood Mead, formerly State Engineer of Wyoming, later professor of irrigation engineering at the Colorado Agricultural College, and afterwards chief of the Bureau of Irrigation of the Department of Agriculture, has accepted the position of chief of irrigation investigations for Australia from the British Government, at a salary of $15,000 per annum. He will leave for Australia in about a month.

Galen W. Pearsons, civil and mechanical engineer, Kansas City, Mo., died recently at his home in that city, aged 75 years. He was closely associated with the construction of the water-works of Bangor, Me.; Leavenworth, Kan.; Marshall, Mo.; Memphis, Tenn., and several other cities. In 1888 be was appointed assistant city engineer of Kansas City, and he was connected with the engineering department of that city thereafter up to the time of his death.

BUSINESS NOTES.

Mr.J. C. Van Doorn has been appointed northwestern sales agent of the Universal Portland Cement Co., with offices in the Security Bank Building, Minneapolis.

Mr. D. N. Carlin, manager of sales of the Thomas Carlin's Sons Co., Allegheny, Pa., has sailed for a trip through England and Germany.

The statement of earnings of the Chicago Pneumatic Tool Co. for the half year ending June 30, 1907. shows a total profit of $507,528.12, which, after deducting for depreciation and renewals of buildings and plant, and developing and perfecting new tools, leaves a net profit of $398,894.54. Out of this sum the sinking fund reserve and the reserve for bond interest have been set aside and two quarterly dividends paid, the remainder, $190,818.88, being carried to the surplus. The latter now amounts to $1,069,228.32.

TRADE PUBLICATIONS.

A small folder setting forth the merits of the Buckeye blue-printing machine, and giving a partial list of its users, is being sent out by the Buckeye Engine Co., Salem, O.

A handsome catalogue entitled "A Reading on the Rod," issued by W. & L. E. Gurley, Troy, N. Y., describes the manufacture and features of their many styles of leveling rods and flag poles. The illustrations are particularly fine and make the selection of a rod from the catalogue easy by being colored exactly the same as the rods themselves.

The American Engineering Co., engineers and contractors, Indianapolis, Ind., have issued two pamphlets containing reprints of articles written by the president of the company, Mr. Chas. N. Wilson. The first contains a careful study of the development and influence of electric roads, which appeared in a series of articles in The Tradesman, and the second a discussion entitled "Why Forty-Nine Projected Electric Roads Fail and the Fiftieth Succeeds," which was printed in the Interurban Railway Journal.

The Compressol system of foundations is described in a recent booklet by the Hennebique Construction Co., U. S. representatives of the system. The apparatus for doing the work is illustrated and explained, and the methods and advantages are fully set forth. Reproductions of photographs show foundations being constructed by this system abroad.

An explanation of a system of accounting by which the details of a foundry business can be analyzed carefully has been written by Mr. William Francis Russell and published by Gunn, Richards & Co. The foundry business rarely pays as much profit as many other industries requiring equal capital, and this pamphlet points out some of the reasons for such an unsatisfactory condition.

A catalogue from the Columbus Tent & Awning Co., Columbus, O., gives prices and dimensions of a great variety of tents for contractors, camping, meetings and other purposes. Wall tents, hip roof tents, compartment tents, shelters, and tents for the many purposes required by contractors are described and quotations attached for various weights of canvas.

"Some Information About the Reinforcing of Concrete" is the title of a small book issued by the Inland Steel Co., Chicago, which contains much interesting material for engineers, architects and contractors. There are discussions of high-carbon steel rods and bars, the materials from which they are made, and mechanical bond. Data for estimating the cost of concrete reinforcement, and tables of the sizes and weights of the rods and bars made by the company are given at the end of the book.

A new catalogue of the General Fireproofing Co., Youngstown, O., describes and illustrates in detail the pin-connected girder frame for reinforcing concrete, and contains half-tone cuts of work in which the company's system is used. The construction of the girder frame and of the materials used in it are described at considerable length, so as to make clear the points claimed for it. Detail drawings of typical centering for concrete building construction, and descriptions of other concrete reinforcement, such as lug bars, expanded metal, and steel studding, occupy the back part of the book.

The Corrugated Culvert Co., Guthrie, Okla., has sent out a catalogue describing corrugated metal culverts for railways and roads. Photographic illustrations show various sized culverts in place, the covering over the crown in some cases being quite thin, indicating a greater strength than is generally assumed for the older types of construction.

The latest catalogue from the Chicago Bridge & Iron Works, Chicago, is almost entirely devoted to a discussion of water towers for domestic supply and fire protection, and contains handly tables of capacities of tanks, standard dimensions of water towers, weights of pipe, properties of fire nozzles, and strengths of different types of riveted joints. The book is illustrated with interesting views of towers and tanks built by the company, the largest tower having a capacity of 1,200,000 gallons.

Extracts from reports of tests on the Forbes system of water purification are scattered through the pages of a small pamphlet which sets forth the advantages of using the system. Illustrations and prices of different types of sterilizers take up part of the book. The apparatus is made by the Forbes Co., Philadelphia.

A neat book of views showing buildings and other structures in which Red Ring brand cement has been or is now being used, has been sent out by the St. Louis Portland Cement Co. Specifications for granitoid walks by Mr. P. M. Bruner, a pioneer cement sidewalk builder, are given at the end of the book.

The New York Flexible Metallic Hose & Tubing Co., has issued an interesting descriptive pamphlet regarding the design of Nyflexmet metallic hose and tubing. The material consists of spirally twisted and interlocked strips of pliable steel or copper, having their edges formed into lips which are packed with asbestos or rubber. For special purposes such as resisting corrosion from moisture the hose is covered or lined with lead. Besides the ordinary uses of flexible tubing, varities of Nyflexmet hose are made for electric conduits, and air brake and car heating hose.

Wunner's "Bitumen-Emulsion," a German waterproofing compound used in making walls of cement, brick or stone impervious to water, is described in a pamphlet issued by Mr. Theodore F. Koch, Globe Building, St. Paul, Minn., selling agent for the United States. The compound is mixed with cement mortar or cement concrete, which can then be applied to the walls or masonry even with water oozing through. From three to six pounds of the compound are used to 200 pounds of cement and sand for making waterproof mortar, and from one and one-half to two pounds to every 100 pounds of cement in making concrete.

The claims of the American System of Reinforcing, Chicago, for concrete construction are briefly and clearly stated in a recent pamphlet. In addition to the data there are many views of concrete structures using the American system.

An interesting description of the electrical equipment of the Bath Portland Cement Co., Bath, Pa., has been issued by the Westinghouse Electric & Mfg. Co., who furnished the electrical apparatus. The individual drive system, using induction motors, is installed throughout.

Pneumatic hammers and riveters of a variety of forms are described in a pamphlet from the Dayton Pneumatic Tool Co., Dayton, O., and some suggestions added regarding their use and care. Pneumatic sand rammers for use in foundries and for tamping concrete or clay, pneumatic wood-boring drills, stay-bolt clippers, cylinder hoists, and compressors also receive attention. Tables of loss in transmitting air and flow through orifices are printed at the end of the book.

The Stewart Iron Works Co., Cincinnati, O., is getting out a new set of catalogues of iron fences, gates, fountains, stable fittings and iron reservoir vases, that describe fully these various products.

Kolesch & Co., 130 Fulton St., New York, manufacturers of engineers' and architects' supplies, have put on the market a circular slide rule for figuring the strength of gear teeth, according to the formula derived by Mr. Wilfred Lewis. All the variables are used on the rule, and the solution thus becomes a mechanical one.

Rockwell rod and bolt heating furnaces are described in circulars recently issued by the Rockwell Engineering Co., New York. These furnaces are operated with oil or gas fuel and their principal dimensions for all standard designs are listed.

A pamphlet describing the Agrippa chain pipe wrenches calls attention to the facts that they are of all wrought-steel construction, drop forged, with saw-tempered jaws, permanently fastened in a milled pocket in the handle, that the chain is of extra length, and swings from center so that it can be used on either side at will, and that all parts are interchangeable. The wrenches are made by the J. H. Williams Co., Brooklyn, N. Y.

Keystone plumbing pipe covering, a new covering for hot and cold water pipes, is described in a pamphlet recently issued by the H. W. Johns-Manville Co., New York. It is made in two forms; style A, which is lined with asbestos for covering hot-water service or heating pipes to prevent radiation, and style B, which is lined with waterproof paper, for covering cold-water pipes to prevent freezing in winter, or to prevent condensation and dripping of moisture from the cool pipes in summer time. The covering is supplied in 3 ft. lengths, canvassed and with lacing wire so that its application or removal is a simple matter.

A catalogue of standard gears has been issued by the Boston Gear Works, Norfolk Downs, Mass., which lists a great variety of gears, pinions and racks that may be ordered from stock, in steel, cast iron and brass. The extensive facilities of this company for molding or cutting gears to order on short notice are referred to, and detailed instructions are given for ordering standard or special gears and pinions with exactness on emergency orders. In addition to the above, an extensive line of small grooved pulleys, star escape wheels, brass ratchets and pawls, clutches and sprocket chains of all types are kept in stock and are listed.

Part 4 of the Trussed Concrete Steel Co.'s series of bulletins on reinforced concrete, treats of hotels, residences and apartment houses, and discusses the speed of erection, noiseless construction, sound-proof, dust-proof, fire-proof and sanitary qualities, and adaptability to architectural decoration claimed for reinforced concrete buildings. Among the buildings described are the Marlborough-Blenheim Hotel and the Traymore Hotel, Atlantic City, and the Hotel Pontchartrain, Detroit, in which the Kahn system of reinforced concrete is used.

A description of the La Chatelier pyrometer for determining temperatures up to 2,920 degrees Fahr., has been issued by Charles Engelhard, U. S. representative, 41 Cortlandt St., New York. The instrument is now employed in gas, chemical, pottery, steel, iron and other industries in which high temperatures are used. Numerous commendatory letters and interesting data on the melting points of metals and fusible alloys, temperatures of furnaces used in various industries, and tempering occupy a considerable portion of the book.

The National Interlocking Steel Sheeting Co., Chicago, has sent out a small folder dealing with the style P lock for interlocking standard channels without the use of bolts or rivets.

A late Tarvia bulletin from the Barrett Manufacturing Co. gives numerous photographs of macadam roads in Chicago and in cities in the East which have been tarviated. Some interesting views show two sections of the same road, a treated and an untreated section.

A spring lock joint for steel sheet piles is the subject of a booklet issued by the Ransome Concrete Machinery Co. The joint consists of two steel springs, riveted to the piles, which engage each other concentrically forming a tight and rigid connection. The applications of the joint to piles made of plain flat plates, and to reinforced, channel, segmental, corrugated and corner piles are shown. Temporary reinforcement for driving very thin piles or driving in hard ground, consisting of channels fastened to the pile by removable bolts, clamps and a driving shoe, is also shown.

Austin Pioneer dump wagons are fully described in a recent catalogue of the Austin Manufacturing Co., Chicago. The steel axle wagon has a capacity of 1½ cu. yds., the wood axle wagon, 2 cu. yds., and the municipal wagon, 2½ cu. yds. Special emphasis is laid on the hanging of the bottom boards.

The Ferro-Concrete Construction Co., Cincinnati, O., has issued Bulletin F-31, giving views of buildings, foundations retaining walls, tanks and chimneys constructed by them.

Thomas C. Farrell, Washington, N. J., manufacturer and patentee of combined box-cap and shoe-plank holders for molds for concrete construction, has sent out a comprehensive catalogue showing applications of the appliance to a great variety of work. The plank holders consist of metal pieces with vertical sides connected by a horizontal web in the form of an extended H. Two of these holders are used to a set, one on each face of the wall, and are connected by a bolt passing through

the wall. Ordinary plank are inserted into the holders, and do not require any carpenter work other than sawing to the proper length. One of the advantages claimed for the holders is that they save skilled labor, the carpenter and form-setting work being reduced to a minimum. Angle, T-shaped, Y-shaped and curved sections are made for 1, 1½ and 2 in. plank.

Bulletins recently issued by the General Electric Co., Schenectady, describe an improved line of circuit breakers for use with electric railway equipments up to 300 h.-p.; auxiliary contactor equipments for cylinder controllers for operating circuit-break contactors on large cars; standard isolated plant switchboards with fuses; Thomson inclined-coil portable indicating instruments, and the G. E. floor outlet boxes for interior conduit wiring systems in buildings.

Forged and rolled steel pipe flanges are listed in a large and well illustrated catalogue recently published by the American Spiral Pipe Works, Chicago, Ill. This company makes a specialty at its large new plant of pipe flanges for all types of pipe joints, including lap joints and welded flanges, and also of boiler and tank flanges and drop forgings of all classes. A feature of the catalogue is full-size illustrations of cross-sections through one side of every standard form of flange made.

An interesting treatise upon the gas engine is embodied in the catalogue recently prepared by the Weber Gas Engine Co., Kansas City, Mo. Much that is of interest to power users is presented, including a comparison of costs of fuels for steam, oil and gas engines and of current for electric motors for power development. The details of both the Weber multi-cylinder gas engine and the Weber suction gas producer are fully described, special effort having been made to call attention to the methods of construction used in the engines, and provisions made for facilitating their care and maintenance.

CONTRACTING NEWS

OF SPECIAL INTEREST TO

CONTRACTORS, BUILDERS, ENGINEERS AND MANUFACTURERS

ENGINEERING AND BUILDING SUPPLIES

WATER.

Notes Arranged Alphabetically by States.

Alabama City, Ala.—A franchise is reported to have been granted R. A. Mitchell to furnish city with water for domestic purposes. It is proposed to construct plant at once, and Thornton Springs, near Gadsden, is to be used as a source of supply.

Little Rock, Ark.—The Home Water Co. is reported to have decided to expend about $400,000 in improvements, including the extension of water mains to Pulaski Heights.

Etna Mills, Col.—See "Power Plants, Gas and Electricity."

**San Diego, Cal.*—The Southern California Mountain Water Co., which furnishes the supply for San Diego and Coronado, is reported to have on Aug. 15 awarded contracts for improvement of the system to Robt. Sherer & Co., of Los Angeles, for about $150,000.

Monterey, Cal.—The Monterey County Water Co. is reported incorporated with a capital of $2,000,000, and principal office in San Francisco. Directors: Chas. E. Green, H. G. Platt, A. D. Shepard and others.

Los Angeles, Cal.—Bids will be received by the Bd. of Water Comrs. (Wm. Mulholland, Supt.), until Sept. 30 for 2 water tube boilers of 300 h.-p. ea. and one 7,000,000 gal. cross-compound pumping engine; also same time and place for 6,000 tons of standard hub and spigot c. i. water pipe, as advertised in The Engineering Record. F. J. Fischer, Chief Mechanical Engr.

Canon City, Colo.—Bids will be received until September 20 by the City Clk. for furnishing material and constructing an additional system of water works, consisting of a reservoir, located at and near Cottonwood Creek, and a pipe line connecting said reservoir with the present city water main. Probable cost of work, $400,000. A. H. Seely, Mayor.

New York, N. Y.—Bids will be received until Sept. 9 by the Bd. of Health (Thos. Darling, M. D., Pres.) for furnishing and delivering as required, lumber, timber, pipe, fittings, stop cocks, valves and miscellaneous plumbers' and steamfitters' supplies to the Hospitals of the Dept. of Health in the various Boroughs of the City of New York, during year 1907.

*The contract for the construction of main dams for Ashokan reservoir near Brown Station in the towns of Olive and Marbletown, Ulster County (bids opened Aug. 6 by the Bd. of Water Supply of N. Y. City) has been awarded to MacArthur Bros. Co. & Winston Co., of N. Y. City, for $12,669,775. For detailed list of bids received for this work see issue of The Engineering Record of Aug. 10.

Buffalo, N. Y.—Bids will be received until Sept. 10 by the Dept. Public Works (F. G. Ward, Comr.), for 2 vertical triplex boiler feed pumps and feed water heater for the Pumping Station Bureau Water.

Casselton, N. D.—We are informed that it is proposed to construct water works and a sewerage system. No definite action will be taken until a well has been sunk. Engineer, C. A. Hopeman, of Moorhead, Minn.

Mandan, N. D.—P. H. Michaels, of Mansfield, O., is reported interested in the construction of water works at Mandan.

Cincinnati, O.—Engineer Kisinger is reported to have completed specifications for water meters required for remainder of this year. The city is reported to have an appropriation of $13,000 for the purchase of meters.

Cleveland, O.—It is reported that work will soon begin on the construction of the west-side water works tunnel, to cost about $600,000. Chas. F. Schultz, Ch. Engr., Water Works Dept.

Bellevue, O.—Bids will be received until Sept. 5 by the Bd. Pub. Service (W. H. Erdick, Clk.), for constructing reinforced concrete walls around water works storage reservoirs. John C. Overmeyer, Engr., Fremont.

Leesburg, O.—It is stated that bids will be received by the Bd. of Pub. Affairs (W. H. Mason, Clk.) until September 5, for constructing portion of water works.

**Philadelphia, Pa.*—The Millard Constr. Co., of which Senator J. P. McNichol is one of the principal members, was awarded contract on Aug. 24 for the completion of the Torresdale filter plant, for $1,156,410.

**Springfield, Mass.*—The following are the bids opened by the Bd. of Water Comrs. on Aug. 21, for work included under Contract No. 1, Intake Dam and Tunnel, Little River Water Supply (Elbert E. Lochridge, Ch. Engr.: (*a*) Culgin-Pace Contr. Co., 1761 Carter Ave., New York, N. Y. (awarded contract); (*b*) Bruno & Pettitte, 23 Court St., Boston; (*c*) N. Y. Continental Jewell Filtration Co., New York, N. Y.; (*d*) Patk. McGovern, Boston; (*e*) Hugh Nawn Contr. Co., Boston; (*f*) T. A. Gillespie Co., New York, N. Y.; (*g*) H. E. Heningham, Thos. A. Clark and Ellis H. Baillie, New York, N. Y.; (*h*) Jules Brenchard Constr. Co., Yonkers, N. Y.; (*i*) MacArthur Bros. & Co., New York, N. Y.; (*j*) Daniel O'Connel & Sons, Holyoke; (*k*) Winston & Co., Katonah, N. Y.

Tacony turbine pumps are described in a series of pamphlets published by the Tacony Iron Co., Philadelphia, Pa. This company is building four types, three of which embrace single and multi-stage turbine pumps, and the other special sewage pumps. The different standard designs enable a unit to be selected, which will operate most efficiently with the varying capacities and lifts that may be encountered. Special sump draining equipments are made, consisting of vertical shaft pumps for submergence in the pits, and driven by direct-connected motors outside.

What can happen when a steam main bursts or a fitting on the line breaks, or one boiler of a battery gives way, is vividly told in a pamphlet issued by the Lagonda Mfg. Co., Springfield, O., describing the Lagonda automatic boiler cut-off valve. The pamphlet also explains the dangers from ammonia explosions and the way in which the cut-off valve may be used to stop the flow. A number of tests are described to show the certainty with which this type of automatic valve operates in case of accident and the valve is illustrated in detail and its action explained.

Locke regulators are described in an attractive catalogue recently prepared by the Locke Regulator Co., Salem, Mass. The interesting history of the Locke regulator, now a well known feature of power plant equipment, is outlined, and the latest improvements described. The varying designs of regulators are explained, as are also the extensive variety of steam appliances manufactured, including pressure reducing valves, tank valves, pump governors, steam traps, automatic non-return stop valves and other special valve and control apparatus.

Feed water filtration is discussed in a pamphlet just published by James Beggs & Co., New York, descriptive of the Blackburn-Smith feed-water filter and grease extractor. This filter is designed for the removal of sediment, organic matter, grease, oil and other impurities from boiler feed water, or for general water filtration for industrial purposes. Its construction and mode of operation are explained and the advantages derived from its use referred to, including the utilization of condensation from heating systems and condensers with entire freedom from oil and grease.

Johnstown, Colo.—The citizens are reported to be considering the question of issuing $20,000 bonds for water works.

Unionville, Conn.—The Unionville Water Co. is reported to be considering the construction of a storage reservoir, or the securing of an additional water supply from Burlington.

**Vienna, Ga.*—A contract has been let to Walton & Wagner, of Atlanta, Ga., for the construction of water works, consisting of about 2¼ miles of 6 to 10 in. mains, pump, boiler and reservoir for $16,100. The contract for the tower and tank, artesian well and power house has not yet been let. Arthur Pew, Engr., Atlanta.

Pavo, Ga.—The citizens are reported to have voted to issue bonds for water works.

Atlanta, Ga.—The Council is reported to have on Aug. 19 rejected previous bids received for the purchase of pumps.

Shelley, Idaho.—Fred C. Michelson, City Clk., writes that the proposed water works will cost about $6,500.

Concordia, Kan.—Burns & McDonnell, Dwight Bldg., Kansas City, Mo., has been selected to prepare plans and specifications for remodeling the water works at Concordia.

Vernon Center, Minn.—The citizens are reoprted to have voted Aug. 21 to issue $8,000 bonds for the construction of water works. An engine, water tank and mains will be installed.

Brookfield, Mo.—The citizens are reported to have voted to issue $12,000 bonds for the construction of water works.

Hebron, Neb.—A. A. Aehl, City Clerk, writes that it is proposed to remove pumping station to better location, if water supply can be had. Will need new pump and engine if bonds carry.

Franklin, Neb.—J. A. Dickey, City Clk., writes that the citizens on August 26 voted to issue $17,000 bonds for the construction of water works.

Verona, N. J.—The Water Com. (Wm. A. Smith, Chmn.), is stated to have completed its report on the construction of water works, which it estimates at $55,639.

Cazenovia, N. Y.—It is stated that bids will be received until Sept. 4 by the Bd. Water Comrs. (Geo. W. Salisbury, Chmn.) for furnishing and laying 5,433 ft. 4-in. c. i. pipe, 10 hydrants, 2,700 lbs. lead, etc.

Ft. H. G. Wright, N. Y.—Bids will be received until Sept. 16 by Wm. E. Horton, Constr. Q. M., U. S. A., New London, Conn., for furnishing and installing about 1,550 ft. 4-in. pipe, as extension to water system at Ft. H. G. Wright, N. Y.

Bids will be received until Sept. 17 by Geo. R. Stearns, Dir. Dept. Pub. Wks., Philadelphia, Pa., for the 3d St. Pipe extension as per contract No. 131.

**Pawtucket, R. I.*—Wm. H. Barclay, Comr. of Pub. Wks., writes that the contract for constructing pumping station for water works (bids opened Aug. 15) has been awarded to Willmarth & Mackillop, of Pawtucket; cost reported to be about $42,120.

**Bonesteel, S. D.*—M. P. Dowling, Town Clk., writes that the contract for constructing water works (bids opened Aug. 20), has been awarded to C. E. Haakinson, of Sioux City, Ia., for $16,000.

Chattanooga, Tenn.—Mayor W. L. Frierson approved the ordinance authorizing the issue of $900,000 bonds for purchase or construction of municipal water works. The ordinance also provides for preliminary steps to be taken looking to an expert valuation of the present plant and the opening of negotiations with the City Water Co. for a purchase.

Lawrenceburg, Tenn.—See "Power Plants, Gas and Electricity."

Waco, Tex.—It is reported that the Water Comn. has purchased property in East Waco, and the tubular well system, which is used in connection with the artesian supply is to be enlarged.

Royse City, Tex.—The Council is reported to be considering the question of constructing water works.

Lind, Wash.—The citizens are reported to have voted to issue $23,000 bonds for the purchase of the water works. The system will probably be extended and improved.

Linden, Wis.—H. F. Treloor, Village Clk., writes that Geo. Harrop, of South Bend, Ind., is preparing plans for water works, to cost about $8,000.

Thermopolis, Wyo.—Fred. C. Hank, City Clk., writes that bids will probably be called for about Nov. 1 for water works, to cost about $50,000. Engineer, J. B. Chessington, of Thermopolis.

Hamilton, Ont.—At a meeting of Fire and Water Com. on Aug. 21 recommendation of sub-committee, with reference to purchase of electric pumps, was adopted, and Council will be asked to submit by-law to ratepayers sanctioning purchase of electric pumps of sufficient capacity to supply city with water.

Ottawa, Ont.—The City Engr. is reported to be preparing plans for a new reservoir to be located in the newly annexed portion of city, known as Bayswater; it will cost about $150,000.

**Items marked thus give the names of parties awarded contracts.*

SEWERAGE AND SEWAGE DISPOSAL.

Notes Arranged Alphabetically by States.

***Camden, Ark.**—Louis Bauerlein, Secy. Comrs. Improv. Dist. No. 2, writes that the contract for constructing about 12,000 ft. sewers (bids opened Aug. 15) has been awarded to Pormey Paving & Constr. Co., Helena, Ark., for $6,260.

***Fayetteville, Ark.**—Bids were opened on Aug. 22 by the Bd. Improv.. Sewer Dist. No. 1 (I. G. Combs, Camn.) for furnishing material and constructing a system of sewers. (Burns & McDonnell, Engrs., 709 Dwight Bldg., Kansas City, Mo.), and the contract for same was awarded to Clinton W. Watson & Co., of St. Louis, Mo., at the following bid: Excav., under 4 ft., 15 cts. per cu yd.; excav., 4 to 6 ft., 22 cts.; excav., 6 to 8 ft., 28 cts.; excav., over 8 ft., 45 cts.; rock excav., $2.50; macadam, 14 cts. per lin. ft.; 8-in. vit. pipe, 22 cts.; 10-in., 29 cts.; 12-in.. 44 cts.; 15-in., 60 cts.; 18-in., 90 cts.; 8-in. c. i. pipe, $1.10; 10-in., $1.40; 12-in., $2; 16-in., $3; 6-in. on 8-in. Ys. ca. 65 cts.; 6-in on 10-in. Ys, $1; 6-in. on 12-in. Ys, $1.50; manholes, ea., $32; extra concrete, per cu. yd., $7; septic tank, ea., $3,000; filters, ea., $1,500; excav. tank and filters, 50 cts.; special bridges. $200; total cost $71,377. Totals of other bids received were: McIlroy, Reese & Co., Fayetteville, $83,750; Wm. F. Hall, Clinton, Mo., $74,469 and J. O. Severens, Guthrie, Okla., $71,377.

Fairfield, Cal.—The Town Clerk writes that bids will be received on Sept. 30 for the construction of sewerage system, to cost about $20,000.

Willows, Cal.—The City Trus. are reported to be considering the question of constructing a sewerage system.

Etna Mills, Cal.—See "Power Plants, Gas and Electricity."

***Lincoln, Cal.**—Daowing & Sons, of Palo Alto, are reported to have secured the contract for constructing sewer system for $17,342.

Alton, Ill.—An ordinance will probably be introduced at the October meeting of the Bd. of Local Improv., looking to the construction of a trunk sewer to cost about $140,000. Edmond Beall, Mayor; Geo. Gray, City Clk.

Springfield, Ill.—The City Council is reported to be considering the construction of a sewer to supply drainage for the southeastern portion of city. Frank Hamilton, City Engr.

Great Lakes, North Chicago, Ill.—The following are the bids opened at the office of the Bureau fo Navigation, Navy Dept., Washington, D. C., on Aug. 21, for laying sewers and drains at the naval training station. Great Lakes, North Chicago, Ill.. Carmine Roberts, Chicago, $63,252. H. C. Patterson, Muskegon, Mich., $66,500.

Bloomington, Ill.—Bids will be received on Sept. 5 for 1,990 ft. of 15 and 18-in. pipe sewers. Chas. F. Fauntz, City Engr.

Lafayette, Ind.—Bids will be received by the Bd. Pub. Wks. E. H. Andress, Jr., Clk.), until Sept. 4 for constructing a sewer in a portion of 20th St.

We are informed that the question of constructing the Congress St. sewer, has not yet been definitely decided upon. If constructed it will be of pipe, brick and concrete, 15 to 36-in. diam. and cost about $18,000.

Linton, Ind.—Bids will be received until September 16 by the Common Council for constructing a sanitary sewer system consisting of approximately 13 miles of sewer with a disposal plant. Approximate cost, $64,800. Frank Spelbring, City Clk.

Des Moines, Ia.—Steel & Shea are reported to have submitted lowest bid at $37.38 per lin. ft. for the long side of the street and $31.60 for the short side, for the sewer and water connections on Kingman Ave, from 26th to 35th Sts.

Independence, Io.—Bids will be received until Sept. 3 by the City Council for constructing about 4,200 lin. ft. 8 and 12-in. vitrified sewer pipe in portions of several streets. Rufus Brewer, City Clk.

Winfield, Kan.—The question of constructing lateral sewer system, is reported under consideration here.

Togus, Me.—Bids will be received at the office of the Treasurer, Eastern Branch, National Home for Disabled Volunteer Soldiers, Togus, until Sept. 10, for furnishing material, etc., for improving sewerage and drainage system, as advertised in The Engineering Record. Engineer, Geo. W. Fuller, 170 Bway., New York, N. Y.

***Norwood, Mass.**—Engineer Lewis D. Thorpe, Cornhill Bldg., Boston, writes that the lowest and successful bid opened on Aug. 23, for constructing sewers at Norwood was submitted by M. McDonough, of Swampscott, at the following bid: 8,500 cu. yds. earth excav., 8 ft. deep, 60 cts.; 200 cu. yds., 8 to 14 ft. deep, $1.25; 60 cu. yds., 14 to 20 ft. deep, $2; 20 cu. yds., 20 to 26 ft. deep, $3; 800 cu. yds. rock excav., 8 ft. deep, $4; 50 cu. yds., 8 to 14 ft. deep, $6; 10 cu. yds., 14 to 20 ft. deep, $8; 5 cu. yds, 20 to 26 ft. deep, $10; pipe laying, with cement joints: 1,050 ft., 24-in., 50 cts.; 200 ft. 20-in., 50 cts.; 5,100 ft. 15-in., 40 cts.; 275 ft. 12-in., 30 cts.; 1,800 ft. 12-in. 15-in. and 20-in. pipe laying, with sulphur joints, 50 cts.; 1,500 ft. 8-in. sub-drains, 40 cts., 1,000 ft. 6-in. sub-drains, 35 cts.; 3,900 ft. 16-in. c. i. pipe, 40 cts.; 100 cu. yds. concrete masonry, $5; 65 cu. yds. brick masonry, $10.00; 10 cu. yds. screened gravel, $2.50; 6,000 cu. yds. earth embkmt., 45 cts.; 200 lin. ft. spruce piles, 40 cts., and 4 M ft. spruce lumber, $40; total, $19,432. Totals of other bids: W. Shea, Quincy, $19,569; G. W. Bryne, Boston, $19,710; C. E. Trumble, Boston, $19,991; I. E. Palmer, Boston, $20,496; Chas. Gow Co., Boston, $20,529.

Springfield, Mass.—The City Council on Aug. 26 authorized the immediate construction of sewers in Long Hill, Carew and Armory Sts., at a cost of about $19,750.

***Detroit Mich.**—J. A. Mercier, Hammond Bldg., is reported to have secured the contract for 5 city sewers for $25,000.

St. Paul, Minn.—The Bd. of Pub. Wks. is reported to have received from the City Engr. preliminary estimate of the construction of the sewer system to connect the Warrendale system of sewage with that of South St., draining region about Lake Como, without the use of a sewage pumping plant; probable cost $26,000 to $35,000.

***Staples, Minn.**—O. F. Doyle, of St. Cloud, is reported to have secured the contract for constructing sewers (bids opened Aug. 15) for about $30,000. Engineer Oscar Claussen, of St. Paul.

New Ulm, Minn.—It is stated that bids will be received until September 3, by Ernst Wicherski, City Clerk, for constructing concrete sewer on Franklin St.

***Winnebago, Minn.**—The J. W. Turner Co. of Des Moines, Ia., is reported to have secured the contract for constructing sewers for $15,000.

Kansas City, Mo.—Bids will be received until Sept. 5 by E. A. Harper, City Engr., at the office of the Bd. Pub. Wks., for constructing sewers in District No. 299, 212 and 264, Divisions 2, 3 and 4 respectively.

Cape Girardeau, Mo.—Geo. E. Chappell, City Clk., writes that no bids were received on Aug. 19 for constructing proposed sewerage system in Dist. 1.

***Lewistown, Mont.**—Nelson J. Littlejohn is reported to have secured the contract for constructing a main sewer on 5th Ave. (bids opened Aug. 14) for $13,406.

Camden, N. J.—Bids will be received until Sept. 9 by the Bd. Freeholders (Geo. W. Whyte, Chmn.), for constructing a stone and brick culvert on Church Rd., Delaware Township.

***Westfield, N. J.**—L. Thompson, Town Clk., writes that the contract for constructing a trunk sewer from the sewage disposal works to a point near the Madison Hill Road, in Clark Township, a distance of about 2½ miles (bids opened Aug. 5) has been awarded to the New Jersey Contr. & Eng. Co., of Newark.

South Orange, N. J.—The Township of South Orange is about to construct its sewerage system to connect with the Joint Trunk Sewer, having purchased rights from the Township of Millburn and the Village of South Orange. The estimated cost of the sewers in South Orange Township is $150,000. Bids will be received until Sept. 17 for the construction of sewers in portions of the Maplewood and South Orange Heights Dists., as advertised in The Engineering Record. The construction in other districts will follow. The work will be put in under the supervision of Alex. Potter, Consulting Engr. of New York, N. Y. Edw. R. Arcularius, Township Clk.

Trenton, N. J.—Bids will be received until Sept. 3 by the Common Council for constructing sewers in portions of Whittaker Ave., Belvidere and Fowler Sts. Harry B. Salter, City Clk.

***Asbury Park, N. J.**—John L. Coffin, Supt. Dept. of Water and Sewers, writes that the contract for constructing sewers (bids opened Aug. 17) has been awarded to A. E. Marsden & Co., 21 West St., Utica, N. Y., as follows: Lake Ave. sewers, $6,750; ocean outlet, $4,900, and other sewers, $33,835; total contract, $45,488.

New York, N. Y.—Bids will be received by the Park Bd. (Moses Herrman, Pres.) until Sept. 5, for constructing a brick sewer in Van Cortlandt Park.

Olean, N. Y.—It is stated that bids will be received by the Common Council until September 6, for laying 10-in. vitr. pipe sewer in portion of N. 11th St. E. E. Allen, Supt. Streets.

Brooklyn, N. Y.—Bids will be received until Sept. 11 by Bird S. Coler, Boro. Pres., for furnishing material and constructing 12, 15. 18 and 24-in. pipe sewers and house connections in various streets including Ft. Hamilton Ave., 85th, 82d, Montgomery and 49th Sts.

Casselton, N. D.—See "Water."

***Toledo, O.**—It is stated that bids will be received by the Bd. of Pub. Service (Reynold Voit, Secy.), until September 3, for constructing sewers in portions of various streets. Frank I. Consaul, Ch. Engr.

Chagrin Falls, O.—The Walter P. Rice Eng. Co., of Cleveland, have completed and presented to the State Bd. of Health for approval, plans for a sewerage system and sewage purification plant for Chagrin Falls.

***Columbus, O.**—The following is the detail bid of the York Constr. Co., of Columbus, which recently secured the contract for constructing 20-in. sewage force main (bids opened July 10): 11,000 cu. yds. excav., 89 6/11 cts.; 170 sq. yds. repaving, brick, $1.75; 130 sq. yds. repaving, asphalt, $3; 100 lin. ft. curbing reset, 25 cts.; 100 cu. yds. brick masry., $10; 40 cu. yds. concrete, $9; 610 tons c. i. pipe, $41.25 5/61 cts.; 5 tons B. & S. specials, $90; 16 tons flange specials, $115; 9,000 lbs. misc. iron and steel, 6 cts.: total $39,915. Totals of other bids: W. C. Holliday, $39,024; S. T. Knight, Columbus, $53,735; and Baldwin Bros. & Graham, Cleveland, $54,885.

Cincinnati, O.—City Engr. Danenhower is reported to be preparing a survey for a system of storm water sewers south of Liberty St., and between Broadway and Central Ave.

***Port Clinton, O.**—Frank Richardson, of Port Clinton, is reported to have secured the contract for constructing sewers in Dist. 10 (bids opened Aug. 19) for $–,642.

Lakewood, O.—Bids will be received until Sept. 3 by B. M. Cook, Village Clk., for furnishing material and constructing a sewer of vitr. pipe in Park Row. Wm. H. Evers, Eng. Co. Engrs., 237 The Arcade, Cleveland.

Philadelphia, Pa.—Bids will be received by Geo. R. Stearns, Dir. Dept. Pub. Wks., until Sept. 11, for bridges, main sewers, branch sewers, inlets and Pine St. sewer, as advertised in the Engineering Record.

Bids will be received until Sept. 17 by Geo. R. Stearns, Dir. Dept. Pub. Wks. for sewer connecting Upper Roxborough, filters as per contract No. 132.

Rankin, Pa.—The Boro. Council is reported to have passed an ordinance providing for the issue of $50,000 bonds, for enlarging municipal building, erecting a garbage furnace and making street and sewer improvements.

***Mahanoy City, Pa.**—John Cunningham, of Mahanoy City, is reported to have secured contract to build a sewer on 2d St., for $7,000.

City, for furnishing materials and installing complete electric lighting and power system for all buildings and grounds under the jurisdiction of the Department of Public Charities, and comprising the New York City Home for the Aged and Infirm, Blackwell's Island, Boro. of Manhattan: (*a*) aggregate price for whole work, (*b*) aggregate price for the whole work by alternate installing underground conduit lines with service boxes, manholes, transformer vaults and the like complete as specified for all lines outside of buildings: Ideal Electric Cont. Co., 1123 Bway., N. Y. City, *a* $86,410, *b* $112,320; Thompson-Donney Co., 45 York St., Brooklyn, *a* $94,880, *b* $123,760; T. G. Blanchard, *a* $88,697, *b* $128,142.

Johnstown, N. Y.—I. M. Everest, of Albany, a representative of the McCaffery Water Motor & Power Co., of Troy, is stated to have secured water privileges along the Caroga and Peck Creeks from Caroga Lake to the Mohawk River and from Peck's Pond to its junction with Caroga Creek, and is seeking privileges in the vicinity of Johnstown, on the said creeks. It is stated that several large power stations will be established in this locality to distribute power in Montgomery, Fulton and Herkimer Counties.

Buffalo, N. Y.—Bids will be received until Sept. 6 by the Bd. of Superv. (Henry D. Feist, Clk.) for furnishing labor and material required in furnishing and installing lockers, gun cases, electric light fixtures, etc., in the armory of the 74th Regt., N. G., N. Y., Buffalo.

West Point, N. Y.—Bids will be received by Maj. J. M. Carson, Jr., Q. M., U. S. M. A., until Sept. 30, for furnishing and installing combination gas and electric light fixtures in old and new Cadet barracks, as advertised in The Engineering Record.

Brooklyn, N. Y.—Bids will be received until Sept. 9 by C. B. J. Snyder, Supt. School Bldgs., New York City, for completing the abandoned contract for the electric equipment in School 109, Boro. Brooklyn.

Rochester, N. Y.—Bids will be received until September 30, by the Comrs. of Bldgs. of Monroe County (G. L. Meade, Chmn.), for furnishing and putting in place 150 h.p. 130 lbs. working pressure internal furnace boiler in the Monroe County Power House, at Rochester; also same date and place for furnishing and installing an electric lighting plant in the basement of the Court House at Rochester.

Hoosick Falls, N. Y.—Application has been made to the Public Service Comn. by the Schaghticoke Electric Co., of Hoosick Falls, for consent to increase its capital stock from $30,000 to $500,000, and also for consent to the issue of $1,750,000 of 5 per cent., 2 year, first mortgage bonds, to be used to develop water rights company has acquired along Hoosick River. If the application is granted, it is proposed to run high-tension transmission line to Schenectady to furnish additional power.

Philadelphia, N. Y.—A. F. Nims, of Philadelphia, is reported to have secured the contract for constructing concrete dam for the municipal electric light plant, for $4,561.

Hickory, N. C.—M. E. Thornton, of Hickory, writes that the contract for constructing a concrete rock reinforced dam with power house, across the Catawba River, at Hickory, and installing 3,000-h.p. turbine water-wheels and electrical apparatus and transmission lines for lighting and power purposes (bids opened Aug. 10) has been awarded to A. F. Hart & Co., of Hickory.

Fargo, N. D.—Geo. Hancock, is reported to have prepared plans for extending and rebuilding the power plant of the Union Light, Heat & Power Co. It is stated that the improvements will cost about $30,000.

Cincinnati, O.—The Little Miami Light, Heat & Power Co., which proposes to harness the Little Miami River, it is stated, has secured additional land along that river, and expects to start work in the fall. The total expenditure, including land and equipment, will be about $1,000,000. Engineers, John W. Hill & Sons, First Natl. Bank Bldg.

Pittsburg, Pa.—The Southside Electric Mfg. Co., is reported to have decided to apply for a charter. The stockholders plan to increase the capital and enlarge the plant for the purpose of furnishing light and heat to residents and stores and factories on the Southside; capital, $65,000. L. J. Regan, Pres., and Peter M. Lippert, Secy. and Treas.

Manayunk, Pa.—Wm. H. Dechant, of Reading, is reported to have secured a contract for building an electric power generator plant in Manayunk for supplying current to surrounding mills. The plant will be situated on Schuylkill River and will cost about $100,000.

. anama.—See "Miscellaneous."

Camp Hill, Pa.—The Camp Hill Fuel & Gas Co., of Camp Hill, is reported to have received a charter, with a capital of $5,000. Incorporators: Robt. Smith, T. K. Van Dyke and others.

** Items marked thus give the names of parties awarded contracts.*

Lancaster, Pa.—Bids will be received until Sept. 20 by Walter A. Miller, Clk., Thaddeus Stevens Industrial School Comn., at his office, Court House, for erecting a power plant and 2 cottages for above school; also the mechanical work at the power plant, also sewers and tunnels from buildings, and heating plant for all buildings; also, same time and place, for erecting a shop for the Stephens Orphans' Home.

Nashville, Tenn.—A building permit is reported to have been granted to the Nashville Gas Co. for the erection of a new brick boiler room, generator and engine room at its plant at 3d Ave.; cost about $10,000.

Lawrenceburg, Tenn.—Bids will be received by the Mayor and Bd. of Aldermen until September 13 for furnishing material and constructing complete a hydro-electric plant for water, lights and power comprising dam and penstocks, turbines, generator, arc lighting apparatus, pole lines, tower and tank, c. i., mains, hydrants, valves, etc., as advertised in The Engineering Record. Walter G. Kirkpatrick, of Jackson, Miss., Engr. R. B. Williams, Mayor.

Ft. Myer, Va.—Bids will be received by Capt. B. B. Hyer, Constr. Q. M., U. S. A., until Sept. 12 for furnishing and installing acetylene gas fixtures in the Isolation Hospital, as advertised in The Engineering Record.

**Tacoma, Wash.*—The Council on Aug. 13 is stated to have decided to accept, conditionally on result of election to be held Sept. 10, the bid of Geo. Milton Savage Co., at $1,750,000, for installing on upper Nisqually River, a municipal hydraulic power plant of 10,000 h.p.

Madison, Wis.—It is reported that the Madison Gas & Electric Co. (John Corscot, Gen. Mgr.) intends expending $75,000 for new machinery and new buildings.

Burlington, Wis.—F. R. Crabtree, it is reported, has completed plans for a factory building, power house and warehouse to be erected by the Burlington Advancement Assoc. (Geo. Waller, Secy.).

Northfield, Wis.—It is stated that the Northfield Light, Heat & Power Co. is seeking a franchise.

Baldwin, Wis.—The Baldwin Electric Light & Fuel Co. is reported incorporated, with a capital of $15,000, by E. J. Cave, O. K. Hawley and Herman Heebink.

Eau Claire, Wis.—The Chippewa Valley Light & Power Co. is reported to have filed a mortgage for $1,000,000, and propose using some of the funds for improvements and extensions.

Muscoda, Wis.—An election is soon to be held, according to reports, to vote on the question of issuing $10,000 bonds for an electric light plant.

Winnipeg, Man.—Bids will be received by the Chmn. Bd. Control, until Oct. 1 (extension of date from Sept. 3), for the construction of general works, and for supply and erection of various portions of equipment for hydro-electric works and station at Point du Bois, for a transmission line between Point du Bois and Winnipeg, and for a receiving transformer station in Winnipeg, etc., as advertised in The Engineering Record.

Hamilton, Ont.—See "Water."

ELECTRIC RAILWAYS.

Notes Arranged Alphabetically by States.

Little Rock, Ark.—J. J. Fiske, Pres. and Gen. Mgr. Little Rock & Pine Bluff Traction Co., Rooms 9 and 10, 501½ Main St., writes that the company is ready to receive figures from railroad contractors upon grading in sections, bridging, track laying, over-head construction, and erection of power house, either in part or as a whole, etc.; also figures from manufacturers and supply houses for wire, steel bridge material, overhead construction material, power-house equipments, cars, etc. It is proposed to build approximately 50 miles of electric interurban street railroad between Little Rock and Pine Bluff, Ark.

Downieville, Cal.—See "Power Plants, Gas and Electricity."

San Jose, Cal.—It is stated that the Peninsular R. R. Co. contemplates building 30 miles of standard-gauge double track.

Westbrook, Conn.—Judge William S. Case, of the Superior Court, is stated to have passed an order declaring the building of the Shore Line Electric Ry. a matter of public convenience and necessity, and permitting the construction of a street railway in the towns of Westbrook, Old Saybrook and Essex.

Belleville, Ill.—The East St. Louis & Eastern Ry. Co. is reported organized. The purpose is to build a road between East St. Louis and Belleville. Incorporators: I. C. Haynes, T. W. Gregory, G. C. Pierce, F. H. Thomas and F. H. Kruger.

South Bend, Ind.—A franchise is reported to have been granted by the Comrs. of St. Joseph County to the Chicago, South Bend & Northern Indiana Traction Co. for an extension in Notre Dame Ave. to the College grounds.

Emmetsburg, Ia.—The Spirit Lake, Emmetsburg & Ft. Dodge Ry. Co. is stated to have filed articles of incorporation with the Secretary of State. Capital $20,000. The company organizes for the purpose of building an interurban railway from Ft. Dodge in a northwesterly direction through Emmetsburg to Spirit Lake, or to some point on the Okoboji Lakes, a distance of 100 miles.

Davenport, Ia.—Articles of incorporation of the Davenport & Manchester Interurban Ry. Co. are stated to have been filed with the Secretary of State. Capital $15,000. The purpose is the construction of an interurban electric railway between Davenport and Manchester. The line will be about 90 miles in length and will parallel the Milwaukee road. Geo. T. Baker, Pres.; F. W. Rank, Secy., and T. J. Halligan, Treas., all of Davenport.

Boston, Mass.—Bids for constructing entrances and exit at Summer St. for the Washington St. tunnel, will be received until Sept. [illegible] by B. [illegible] Beal, Secy. Boston Transit Comn.

Pittsfield, Mass.—A franchise is reported to have been granted by the Bd. of Aldermen [illegible] Berkshire St. Ry. Co. for an extension of [illegible] from East St. to a point beyond the Pleasure Park.

St. Louis, Mo.—The St. Louis, [illegible] & Grant Park Ry. Co., J. G. Hughes, Ch. Engr., [illegible] stated to have completed toward Grand Park about 2 miles of grading. The company will place contracts next month for about 6 miles of additional track, for which franchises have been granted.

Las Vegas, N. M.—The construction of an electric line between this city and Mora is reported contemplated. J. M. Cunningham, Jefferson Raynolds, H. W. Kelly, W. A. Buddecke, of the Las Vegas Ry. & Power Co., are said to be interested.

Grand Forks, N. D.—It is stated that Messrs. Lambrech and Murray, of Minneapolis, Minn., are planning to construct a third rail electric railway from Grand Forks to Carrigan.

Dayton, O.—It is reported that the Dayton Str. Ry. Co. is preparing to construct a railway line 12 miles in length, extending from Southeast Dayton to Dayton View and on out the Salem Pike to the Philadelphia Road in Harrison Township. The road is being promoted by Chas. Bosler, D. Dwyer and A. Emanuel.

Eugene, Ore.—It is reported that the Eugene & Eastern Ry. has just purchased from A. Welsh the franchises granted the Williamette Valley Co. for the construction of a street railway by the city of Eugene, the city of Springfield, and the rights of way between the two cities, and the right of way up the McKenzie River. The deed includes all the properties in connection with the railroads formerly transferred to A. Welsh by the Willamette Valley Co. J. O. Storey, Pres.; A. Welsh, Vice-Pres. and Gen. Mgr.; George Bracher, Treas.

Dauphin, Pa.—The charter for the Dauphin St. Ry. Co., which is to build the line between the Lucknow terminus of the traction company and Dauphin is reported signed by Governor Stuart. Capital, $75,000. A. G. Knisely, President.

Chester, Pa.—It is reported that the Chester Traction Co. is planning to reconstruct about 1 mile of track on Edgemont Ave.

**Johnstown, Pa.*—It is reported that the Southern Cambria St. Ry. Co. has awarded Howard C. Cook, of Johnstown, a contract for ties.

Carrizo Springs, Tex.—It is reported that D. J. Woodward, of San Antonio, is interested in a proposition to build an interurban from Cotulla to Carrizo Springs.

San Angelo, Tex.—J. H. Ransome, of Hereford, Tex., is stated to have been granted an electric street railway franchise by the City Council. Capital $200,000. J. A. Williams is the local representative of the company.

Ft. Worth, Tex.—The American Engineering Co. of Indianapolis, Ind., is stated to have closed a contract for constructing and equipping 60 miles of electric railway to connect Ft. Worth and Mineral Well.

Seattle, Wash.—The City Council is stated to have granted a franchise to the Loyal Ry. Co. to construct and operate a street railway in certain streets of the city.

Colfax, Wash.—It is stated that the survey for the Pullman, La Crosse & Columbia River Electric line, passing about 10 miles south of Colfax, through Union Flat, is about completed. J. O. Staats, of La Crosse, is in charge of the survey.

RAILROADS.

Notes Arranged Alphabetically by States.

Pine Bluff, Ark.—A corps of engineers is reported to be now en route to Pine Bluff to make a survey of thee Pine Bluff, North & South R. R. to be built from Pine Bluff north to some point on the Rock Island. The road will be operated and owned by Pine Bluff capital.

Ft. Smith, Ark.—The Kansas City Southern R. R. Co. (A. F. Rust, Resident Engr., Kansas City, Mo.) is reported to have decided to reconstruct its line in Ft. Smith and also build there large yards.

Pagosa Springs, Colo.—The Pagosa Springs & Del Norte R. R. Co. is reported incorporated, to construct a line from Juanita on the Denver & Rio Grande R. R. in Archuleta County to Del Norte, another branch of the same road in Rio Grande County.

Denver, Colo.—The Denver, Laramie & Pacific R. R. Co., which is reported to have been recently incorporated to build a new road between Denver and Seattle, Wash., is reported to be securing rights of way, etc. S. M. Nevius, the Chief Engineer, is reported to be now in Casper, Wyo.

Athens, Ga.—The citizens are reported to be considering the raising of stock for the Athens &Carolina R. R., to be constructed from Athens to Anderson, S. C. Mayor Dorsey, Prof. Branson and T. J. Scott, all of Athens, are reported on the committee from Athens.

Covington, Ind.—The Covington & Wabash Valley R. R. Co. is reported incorporated, with a capital of $50,000, to build a railroad from Covington to Silverwood, a distance of about 13 miles. Directors: Wm. G. Ruhl, 2728 Magnolia Ave., Chicago, Ill.; Chas. Walter Leinbach, Wm. E. Banebrake and Geo. P. Schwinn, all of Covington.

Sulphur, Ind. Ter.—The surveying of the Sulphur, Coalgate & Southeastern R. R., chartered to build from Sulphur eastward to Paris, Tex., is reported to be now in progress through the Chicasaw Nation. It is proposed to construct the line through Hickory, Pontotac and Coalgate. The Commercial Club of Hickory is reported to have closed a contract with company, guaranteeing right of way, terminals and $800 in cash. The citizens of Sulphur are reported to have given $1,500 toward the expenses of the survey.

Pella, Ia.—The Waterloo, Pella & Southwestern R. R. Co. is reported organized with principal office at Pella, and with B. F. Keables, Pres.; E. A. Harris, Gen. Mgr., and T. L. Blank, Secy., to construct a railroad 120 miles long and with 20 miles of sidings. The principal towns along the line will be Waterloo, Traer, Toledo, Tama, Sheridan, Grinnell, Sully, Pella, Howell, Durham, Attica, Columbia, Olmitz and Chariton.

Arkansas City, Kan.—It is reported that it is proposed to extend the Midland Valley R. R. (J. F. Holden, Gen. Mgr., Muskogee, Ind. Ter.) from Arkansas City to the northwest. The length of the road to be built will be about 190 miles, with terminals at Dodge City.

Billings, Mont.—It is reported that the North-Western R. R. Co. (E. C. Carter, Ch. Engr., Chicago, Ill.), which is planning to extend its line to the coast, will enter Montana through the Yellowstone valley, and will pass through Billings. The road will be built northward from Belle Fourche, S. D., for 100 miles, and will then extend due west, up the Yellowstone valley to Billings, thence to Livingstone and Helena, and across Idaho and Washington by the most direct route possible to Seattle.

Cleveland, O.—It is reported that extensive improvements to the Conway yards on the Ft. Wayne R. R. are contemplated by the Pennsylvania R. R. Co. (Alex. Shand, Ch. Engr., Philadelphia, Pa.).

Swissvale, Pa.—The Pennsylvania R. R. Co. (Alex. C. Shand, Ch. Engr., Philadelphia) is reported to have decided to let contract for elimination of grade crossing at Braddock Ave., in Swissvale. The tracks will be elevated and a subway constructed; cost about $50,000.

Mitchell, S. D.—L. L. Ness, of Mitchell; O. E. Cassem, of Madison, Wis., and R. F. Schulz, of Brookings, are reported to be on the committee of business men which is investigating the question of constructing a railroad between Mitchell and Marshall, Minn.

Decatur, Tex.—M. J. Healy and Col. L. J. Polk are reported to be planning to build the East Line from McKinney, Tex., to Mexico, but for the present, it is said, they propose to make Decatur the western terminal.

PUBLIC BUILDINGS.

Notes Arranged Alphabetically by States.

Oakland, Cal.—Arrangements are being made by the Claremont Hospital Assoc. (Dr. H. G. Thomas, Pres.), according to reports, to erect a hospital at a cost of $130,000.

Las Animas, Colo.—Bids will be received at the Bureau of Suplies and Accounts, Navy Dept., Washington, D. C., until Sept. 17, for the construction of quarters at the U. S. naval hospital, New Fort Lyon, Las Animas, Colo. Applications for proposals should refer to Schedule 225. E. B. Rogers, Paymaster Gen'l., U. S. N.
